$ man XtRemoveBlockHook.3

XtAppAddBlockHook(3) XT FUNCTIONS XtAppAddBlockHook(3)

NAME

   XtAppAddBlockHook, XtRemoveBlockHook - register a block hook procedure

SYNTAX

   #include <X11/Intrinsic.h>

   XtBlockHookId XtAppAddBlockHook(XtAppContext app_context, XtBlockHookProc proc, XtPointer

       client_data);

   void XtRemoveBlockHook(XtBlockHookId id);

ARGUMENTS

   app_context

       Specifies the application context.

   proc   Specifies the block hook procedure.

   num_args Specifies the application-specific data to be passed to the block hook.

DESCRIPTION

   XtAppAddBlockHook registers the specified procedure and returns an identifier for it. The

hook is called at any time in the future when the Intrinsics are about to block pending some input.

Block hook procedures are removed automatically and the XtBlockHookId is destroyed when the application context in which they were added is destroyed.

XtRemoveBlockHook removes the specified block hook procedure from the list in which it was registered.
