\$ man aio_write.3

AIO_WRITE(3) Linux Programmer's Manual AIO_WRITE(3)

NAME

aio_write - asynchronous write

SYNOPSIS

```
#include <aio.h>
```

```
int aio_write(struct aiocb *aiocbp);
```

Link with -lrt.

DESCRIPTION

The `aio_write()` function queues the I/O request described by the buffer pointed to by `aiocbp`. This function is the asynchronous analog of `write(2)`. The arguments of the call `write(fd, buf, count)`

correspond (in order) to the fields `aio_fildes`, `aio_buf`, and `aio_nbytes` of the structure pointed to by `aiocbp`. (See `aio(7)` for a description of the `aiocb` structure.)

If `O_APPEND` is not set, the data is written starting at the absolute position `aiocbp->aio_offset`, regardless of the file offset. If `O_APPEND` is set, data is written at the end of the file in the same order as `aio_write()` calls are made. After the call, the value of the file offset is unspecified.

The "asynchronous" means that this call returns as soon as the request has been enqueued; the write may or may not have completed when the call returns. One tests for completion using `aio_error(3)`. The return status of a completed I/O operation can be obtained `aio_return(3)`. Asynchronous notification of I/O completion can be obtained by setting `aiocbp->aio_sigevent` appropriately; see `sigevent(7)` for details.

If `_POSIX_PRIORITYIO` is defined, and this file supports it, then the asynchronous op?

eration is submitted at a priority equal to that of the calling process minus
aiocbp-> aio_reqprio.

The field aiocbp-> aio_lio_opcode is ignored.

No data is written to a regular file beyond its maximum offset.

RETURN VALUE

On success, 0 is returned. On error, the request is not enqueued, -1 is returned, and er?
rno is set appropriately. If an error is detected only later, it will be reported via
aio_return(3) (returns status -1) and aio_error(3) (error status?whatever one would have
gotten in errno, such as EBADF).

ERRORS

EAGAIN Out of resources.

EBADF aio_fildes is not a valid file descriptor open for writing.

EFBIG The file is a regular file, we want to write at least one byte, but the starting
position is at or beyond the maximum offset for this file.

EINVAL One or more of aio_offset, aio_reqprio, aio_nbytes are invalid.

ENOSYS aio_write() is not implemented.

VERSIONS

The aio_write() function is available since glibc 2.1.

ATTRIBUTES

For an explanation of the terms used in this section, see attributes(7).

??

?Interface ? Attribute ? Value ?

??

?aio_write() ? Thread safety ? MT-Safe ?

??

CONFORMING TO

POSIX.1-2001, POSIX.1-2008.

NOTES

It is a good idea to zero out the control block before use. The control block must not be
changed while the write operation is in progress. The buffer area being written out must
not be accessed during the operation or undefined results may occur. The memory areas in?
volved must remain valid.

Simultaneous I/O operations specifying the same aiocb structure produce undefined results.
