Rocky Enterprise Linux 9.2 Manual Pages on command 'apport-unpack.1'

$ man apport-unpack.1

apport-unpack(1)   General Commands Manual   apport-unpack(1)

NAME

   apport-unpack - extract the fields of a problem report to separate files

SYNOPSIS

   apport-unpack report target-directory

DESCRIPTION

   A problem report, as produced by apport is a single file with a set of key/value pairs in

   the RFC822 syntax. This tool disassembles a report such that the value of each entry is

   written into a separate file, with the key as file name. This is particularly useful for

   large binary data like the core dump.

   report is either a path to an existing apport crash report, or '-' to read from stdin.

   The target-directory must either be nonexisting or empty.

AUTHOR

   apport and the accompanying tools are developed by Martin Pitt <martin.pitt@ubuntu.com>.
