Rocky Enterprise Linux 9.2 Manual Pages on command 'bluetoothd.8'

\$ man bluetoothd.8

BLUETOOTHD(8) System management commands BLUETOOTHD(8)

NAME

bluetoothd - Bluetooth daemon

SYNOPSIS

```
bluetoothd [--version] | [--help]
bluetoothd [--nodetach] [--compat] [--experimental] [--debug=<files>] [--plugin=<plug?
ins>] [--noplugin=<plugins>]
```

DESCRIPTION

This manual page documents briefly the bluetoothd daemon, which manages all the Bluetooth devices. bluetoothd can also provide a number of services via the D-Bus message bus system.

OPTIONS

- v, --version
Print bluetoothd version and exit.
- h, --help
Print bluetoothd options and exit.
- n, --nodetach
Enable logging in foreground. Directs log output to the controlling terminal in addition to syslog.
- f, --configfile
Specifies an explicit config file path instead of relying on the default path(/etc/bluetooth/main.conf) for the config file.
- d, --debug=<file1>:<file2>:...

Sets how much information bluetoothd sends to the log destination (usually syslog's "daemon" facility). If the file options are omitted, then debugging information from all the source files are printed. If file options are present, then only debug prints from that source file are printed. The option can be a pattern containing "*" and "?" characters.

Example: --debug=src/adapter.c:src/agent.c

-p, --plugin=<plugin1>,<plugin2>,..

Load these plugins only. The option can be a pattern containing "*" and "?" characters.

-P, --noplugin=<plugin1>,<plugin2>,..

Never load these plugins. The option can be a pattern containing "*" and "?" characters.

-C, --compat

Provide deprecated command line interfaces.

-E, --experimental

Enable experimental interfaces. Those interfaces are not guaranteed to be compatible or present in future releases.

FILES

/etc/bluetooth/main.conf

Location of the global configuration file.
