Linux Ubuntu 22.4.5 Manual Pages on command 'bundle-binstubs2.7.1'

$ man bundle-binstubs2.7.1

BUNDLE-BINSTUBS(1)   BUNDLE-BINSTUBS(1)

NAME

   bundle-binstubs - Install the binstubs of the listed gems

SYNOPSIS

   bundle binstubs GEM_NAME [--force] [--path PATH] [--standalone]

DESCRIPTION

   Binstubs are scripts that wrap around executables. Bundler creates a small Ruby

   file (a binstub) that loads Bundler, runs the command, and puts it into bin/. Bin?

   stubs are a shortcut-or alternative- to always using bundle exec. This gives you a

   file that can be run directly, and one that will always run the correct gem version

   used by the application.

   For example, if you run bundle binstubs rspec-core, Bundler will create the file

   bin/rspec. That file will contain enough code to load Bundler, tell it to load the

   bundled gems, and then run rspec.

   This command generates binstubs for executables in GEM_NAME. Binstubs are put into

   bin, or the --path directory if one has been set. Calling binstubs with [GEM [GEM]]

   will create binstubs for all given gems.

OPTIONS

   --force

       Overwrite existing binstubs if they exist.

   --path The location to install the specified binstubs to. This defaults to bin.

   --standalone

Makes binstubs that can work without depending on Rubygems or Bundler at
runtime.

--shebang

Specify a different shebang executable name than the default (default
?ruby?)

BUNDLE INSTALL --BINSTUBS

To create binstubs for all the gems in the bundle you can use the --binstubs flag
in bundle install(1) bundle-install.1.html.
