Rocky Enterprise Linux 9.2 Manual Pages on command 'docker-healthcheck-run.1'

$ man docker-healthcheck-run.1

podman-healthcheck-run(1)() podman-healthcheck-run(1)()

NAME

podman-healthcheck-run - Run a container healthcheck

SYNOPSIS

podman healthcheck run container

DESCRIPTION

Runs the healthcheck command defined in a running container manually. The resulting error

codes are defined as follows:

? 0 = healthcheck command succeeded

? 1 = healthcheck command failed

? 125 = an error has occurred

Possible errors that can occur during the healthcheck are: * unable to find the container

* container has no defined healthcheck * container is not running
