Rocky Enterprise Linux 9.2 Manual Pages on command 'docker-machine-start.1'

\$ man docker-machine-start.1

```
podman-machine-start(1)()          podman-machine-start(1)()
```

NAME

podman-machine-start - Start a virtual machine

SYNOPSIS

podman machine start [name]

DESCRIPTION

Starts a virtual machine for Podman.
Podman on macOS requires a virtual machine. This is because containers are Linux - con? tainers do not run on any other OS because containers' core functionality are tied to the Linux kernel.
Only one Podman managed VM can be active at a time. If a VM is already running, podman ma? chine start will return an error.
podman machine start starts a Linux virtual machine where containers are run.

OPTIONS

--help
Print usage statement.

EXAMPLES

```
$ podman machine start myvm
```
