Rocky Enterprise Linux 9.2 Manual Pages on command 'docker-manifest-exists.1'

$ man docker-manifest-exists.1

podman-manifest-exists(1)()   podman-manifest-exists(1)()

NAME

   podman-manifest-exists - Check if the given manifest list exists in local storage

SYNOPSIS

   podman manifest exists manifest

DESCRIPTION

   podman manifest exists checks if a manifest list exists on local storage. Podman will re?

   turn an exit code of 0 when the manifest is found. A 1 will be returned otherwise.   An

   exit code of 125 indicates there was another issue.

OPTIONS

  --help, -h

   Print usage statement.

EXAMPLE

   Check if a manifest list called list1 exists (the manifest list does actually exist).

      $ podman manifest exists list1

      $ echo $?

      0

      $

   Check if an manifest called mylist exists (the manifest list does not actually exist).

      $ podman manifest exists mylist

      $ echo $?

      1

      $
