$ man docker-untag.1

podman-untag(1)()   podman-untag(1)()

NAME

    podman-untag - Removes one or more names from a locally-stored image

SYNOPSIS

    podman untag image [name[:tag]...]

    podman image untag image [name[:tag]...]

DESCRIPTION

    Remove one or more names from an image in the local storage. The image can be referred to

    by ID or reference. If a no name is specified, all names are removed the image.   If a

    specified name is a short name and does not include a registry localhost/ will be prefixed

    (e.g., fedora -> localhost/fedora). If a specified name does not include a tag :latest

    will be appended (e.g., localhost/fedora -> localhost/fedora:latest).

OPTIONS

  --help, -h

    Print usage statement

EXAMPLES

      $ podman untag 0e3bbc2

      $ podman untag imageName:latest otherImageName:latest

      $ podman untag httpd myregistryhost:5000/fedora/httpd:v2
