RUN-MAILCAP(1)   Run Mailcap Programs   RUN-MAILCAP(1)

NAME

    run-mailcap, view, see, edit, compose, print - execute programs via entries in the mailcap

    file

SYNOPSIS

    run-mailcap --action=ACTION [--option[=value]] [MIME-TYPE:[ENCODING:]]FILE [...]

    The see, edit, compose and print versions are just aliases that default to the view, edit,

    compose, and print actions (respectively).

DESCRIPTION

    run-mailcap (or any of its aliases) will use the given action to process each mime-

    type/file in turn. Each file is specified as its mime-type, its encoding (e.g. compres?

    sion), and filename together, separated by colons. If the mime-type is omitted, an at?

    tempt to determine the type is made by trying to match the file's extension with those in

    the mime.types files.   If no mime-type is found, a last attempt will be done by running

    the file command, if available. If the encoding is omitted, it will also be determined

    from the file's extensions. Currently supported encodings are gzip (.gz), bzip2 (.bz2),

    xz (.xz), and compress (.Z). A filename of "-" can be used to mean "standard input", but

    then a mime-type must be specified.

    Both the user's files (~/.mailcap; ~/.mime.types) and the system files (/etc/mailcap;

    /etc/mime.types) are searched in turn for information.

EXAMPLES

    see picture.jpg

    print output.ps.gz

compose text/html:index.htm

        extract-mail-attachment msg.txt | see image/tiff:gzip:-

    OPTIONS

        All options are in the form --<opt>=<value>.

        --action=<action>

            Performs the specified action on the files. Valid actions are view, cat (uses only

            "copiousoutput" rules and sends output to STDOUT) , compose, composetyped, edit and

            print. If no action is specified, the action will be determined by how the program

            was called.

        --debug

            Turns on extra information to find out what is happening.

        --nopager

            Ignores any "copiousoutput" directive and sends output to STDOUT.

        --norun

            Displays the found command without actually executing it.

SECURITY

    A temporary symbolic link to the file is opened if the file name matches the Perl regular

    expression "[^[:alnum:],.:/@%^+=_-]", in order to protect from the injection of shell com?

    mands, and to make sure that the name can always be displayed in the current locale. In

    addition, the file is opened using its absolute path to prevent the injection of command-

    line arguments, for instance using file names starting with dashes.
