Rocky Enterprise Linux 9.2 Manual Pages on command 'expm1f.3'

$ man expm1f.3

NAME

    expm1, expm1f, expm1l - exponential minus 1

SYNOPSIS

    #include <math.h>

    double expm1(double x);

    float expm1f(float x);

    long double expm1l(long double x);

    Link with -lm.

  Feature Test Macro Requirements for glibc (see feature_test_macros(7)):

    expm1():

      _ISOC99_SOURCE || _POSIX_C_SOURCE >= 200112L

        || _XOPEN_SOURCE >= 500

        || /* Since glibc 2.19: */ _DEFAULT_SOURCE

        || /* Glibc versions <= 2.19: */ _BSD_SOURCE || _SVID_SOURCE

    expm1f(), expm1l():

      _ISOC99_SOURCE || _POSIX_C_SOURCE >= 200112L

        || /* Since glibc 2.19: */ _DEFAULT_SOURCE

        || /* Glibc versions <= 2.19: */ _BSD_SOURCE || _SVID_SOURCE

DESCRIPTION

    These functions return a value equivalent to

      exp(x) - 1

    The result is computed in a way that is accurate even if the value of x is near zero?a

case where exp(x) - 1 would be inaccurate due to subtraction of two numbers that are nearly equal.

RETURN VALUE

On success, these functions return exp(x) - 1.

If x is a NaN, a NaN is returned.

If x is +0 (-0), +0 (-0) is returned.

If x is positive infinity, positive infinity is returned.

If x is negative infinity, -1 is returned.

If the result overflows, a range error occurs, and the functions return -HUGE_VAL, -HUGE_VALF, or -HUGE_VALL, respectively.

ERRORS

See math_error(7) for information on how to determine whether an error has occurred when calling these functions.

The following errors can occur:

Range error, overflow

errno is set to ERANGE (but see BUGS). An overflow floating-point exception (FE_OVERFLOW) is raised.

ATTRIBUTES

For an explanation of the terms used in this section, see attributes(7).

???
?Interface   ? Attribute   ? Value   ?
???
?expm1(), expm1f(), expm1l() ? Thread safety ? MT-Safe ?
???

CONFORMING TO

C99, POSIX.1-2001, POSIX.1-2008.

BUGS

Before glibc 2.17, on certain architectures (e.g., x86, but not x86_64) expm1() raised a bogus underflow floating-point exception for some large negative x values (where the func‐ tion result approaches -1),

Before approximately glibc version 2.11, expm1() raised a bogus invalid floating-point ex‐ ception in addition to the expected overflow exception, and returned a NaN instead of pos‐ itive infinity. for some large positive x values,

Before version 2.11, the glibc implementation did not set errno to ERANGE when a range er?

ror occurred.
