$ man getgrouplist.3

GETGROUPLIST(3)   Linux Programmer's Manual   GETGROUPLIST(3)

NAME

   getgrouplist - get list of groups to which a user belongs

SYNOPSIS

   #include <grp.h>

   int getgrouplist(const char *user, gid_t group,

          gid_t *groups, int *ngroups);

 Feature Test Macro Requirements for glibc (see feature_test_macros(7)):

   getgrouplist():

     Since glibc 2.19:

       _DEFAULT_SOURCE

     Glibc 2.19 and earlier:

       _BSD_SOURCE

DESCRIPTION

   The getgrouplist() function scans the group database (see group(5)) to obtain the list of

   groups that user belongs to. Up to *ngroups of these groups are returned in the array

   groups.

   If it was not among the groups defined for user in the group database, then group is in?

   cluded in the list of groups returned by getgrouplist(); typically this argument is speci?

   fied as the group ID from the password record for user.

   The ngroups argument is a value-result argument: on return it always contains the number

   of groups found for user, including group; this value may be greater than the number of

   groups stored in groups.

RETURN VALUE

If the number of groups of which user is a member is less than or equal to *ngroups, then the value *ngroups is returned.

If the user is a member of more than *ngroups groups, then getgrouplist() returns -1.   In this case, the value returned in *ngroups can be used to resize the buffer passed to a further call getgrouplist().

VERSIONS

This function is present since glibc 2.2.4.

ATTRIBUTES

For an explanation of the terms used in this section, see attributes(7).

```
??????????????????????????????????????????????????????
?Interface      ? Attribute    ? Value        ?
??????????????????????????????????????????????????????
?getgrouplist() ? Thread safety ? MT-Safe locale ?
??????????????????????????????????????????????????????
```

CONFORMING TO

This function is nonstandard; it appears on most BSDs.

BUGS

In glibc versions before 2.3.3, the implementation of this function contains a buffer-overrun bug: it returns the complete list of groups for user in the array groups, even when the number of groups exceeds *ngroups.

EXAMPLES

The program below displays the group list for the user named in its first command-line ar?gument.   The second command-line argument specifies the ngroups value to be supplied to getgrouplist(). The following shell session shows examples of the use of this program:

```
$ ./a.out cecilia 0
getgrouplist() returned -1; ngroups = 3
$ ./a.out cecilia 3
ngroups = 3
16 (dialout)
33 (video)
100 (users)
```

Program source

```c
#include <stdio.h>
#include <stdlib.h>
#include <grp.h>
#include <pwd.h>
int
main(int argc, char *argv[])
{
    int ngroups;
    struct passwd *pw;
    struct group *gr;
    if (argc != 3) {
        fprintf(stderr, "Usage: %s <user> <ngroups>\n", argv[0]);
        exit(EXIT_FAILURE);
    }
    ngroups = atoi(argv[2]);
    gid_t *groups = malloc(sizeof(*groups) * ngroups);
    if (groups == NULL) {
        perror("malloc");
        exit(EXIT_FAILURE);
    }
    /* Fetch passwd structure (contains first group ID for user) */
    pw = getpwnam(argv[1]);
    if (pw == NULL) {
        perror("getpwnam");
        exit(EXIT_SUCCESS);
    }
    /* Retrieve group list */
    if (getgrouplist(argv[1], pw->pw_gid, groups, &ngroups) == -1) {
        fprintf(stderr, "getgrouplist() returned -1; ngroups = %d\n",
                ngroups);
        exit(EXIT_FAILURE);
    }
    /* Display list of retrieved groups, along with group names */
```

```c
        fprintf(stderr, "ngroups = %d\n", ngroups);

        for (int j = 0; j < ngroups; j++) {

            printf("%d", groups[j]);

            gr = getgrgid(groups[j]);

            if (gr != NULL)

                printf(" (%s)", gr->gr_name);

            printf("\n");

        }

        exit(EXIT_SUCCESS);

    }
```
