Rocky Enterprise Linux 9.2 Manual Pages on command 'git-credential-cache--daemon.1'

$ man git-credential-cache--daemon.1

GIT-CREDENTIAL-CAC(1)   Git Manual   GIT-CREDENTIAL-CAC(1)

NAME

   git-credential-cache--daemon - Temporarily store user credentials in memory

SYNOPSIS

   git credential-cache?daemon [--debug] <socket>

DESCRIPTION

      Note

      You probably don?t want to invoke this command yourself; it is started automatically

      when you use git-credential-cache(1).

   This command listens on the Unix domain socket specified by <socket> for

   git-credential-cache clients. Clients may store and retrieve credentials. Each credential

   is held for a timeout specified by the client; once no credentials are held, the daemon

   exits.

   If the --debug option is specified, the daemon does not close its stderr stream, and may

   output extra diagnostics to it even after it has begun listening for clients.
