$ man git-mailsplit.1

GIT-MAILSPLIT(1)   Git Manual   GIT-MAILSPLIT(1)

NAME

git-mailsplit - Simple UNIX mbox splitter program

SYNOPSIS

git mailsplit [-b] [-f<nn>] [-d<prec>] [--keep-cr] [--mboxrd]

   -o<directory> [--] [(<mbox>|<Maildir>)...]

DESCRIPTION

Splits a mbox file or a Maildir into a list of files: "0001" "0002" .. in the specified

directory so you can process them further from there.

   Important

   Maildir splitting relies upon filenames being sorted to output patches in the correct

   order.

OPTIONS

   <mbox>

   Mbox file to split. If not given, the mbox is read from the standard input.

   <Maildir>

   Root of the Maildir to split. This directory should contain the cur, tmp and new

subdirectories.

-o\<directory\>

Directory in which to place the individual messages.

-b

If any file doesn?t begin with a From line, assume it is a single mail message instead of signaling error.

-d\<prec\>

Instead of the default 4 digits with leading zeros, different precision can be specified for the generated filenames.

-f\<nn\>

Skip the first \<nn\> numbers, for example if -f3 is specified, start the numbering with 0004.

--keep-cr

Do not remove \r from lines ending with \r\n.

--mboxrd

Input is of the "mboxrd" format and "^>+From " line escaping is reversed.
