GIT-PACK-REDUNDANT(1)   Git Manual   GIT-PACK-REDUNDANT(1)

NAME

   git-pack-redundant - Find redundant pack files

SYNOPSIS

   git pack-redundant [--verbose] [--alt-odb] < --all | .pack filename ... >

DESCRIPTION

   This program computes which packs in your repository are redundant. The output is suitable

   for piping to xargs rm if you are in the root of the repository.

   git pack-redundant accepts a list of objects on standard input. Any objects given will be

   ignored when checking which packs are required. This makes the following command useful

   when wanting to remove packs which contain unreachable objects.

   git fsck --full --unreachable | cut -d ' ' -f3 | \ git pack-redundant --all | xargs rm

OPTIONS

   --all

      Processes all packs. Any filenames on the command line are ignored.

   --alt-odb

      Don?t require objects present in packs from alternate object directories to be present

      in local packs.

   --verbose

      Outputs some statistics to stderr. Has a small performance penalty.
