Rocky Enterprise Linux 9.2 Manual Pages on command 'mk_modmap.8'

\$ man mk_modmap.8

MK_MODMAP(8) System Manager's Manual MK_MODMAP(8)

NAME

mk_modmap - translate a Linux keytable file into an xmodmap file

SYNOPSIS

mk_modmap [-v] keymap_file

DESCRIPTION

The `mk_modmap` command tries to translate a Linux console keytable file into a file that can be parsed by `xmodmap`, and used within X. It outputs the results to standard out.

If the `-v` flag is used, verbose output is given.

It requires the X header files to be installed. (In Debian, these are in the "xlibs-dev" package).

NOTES

Since XFree version 2.1, X initialises its keymap using the Linux keymap, so `xmodmap` will often be superfluous.
