Rocky Enterprise Linux 9.2 Manual Pages on command 'mkhomedir_helper.8'

$ man mkhomedir_helper.8

NAME

   mkhomedir_helper - Helper binary that creates home directories

SYNOPSIS

   mkhomedir_helper {user} [umask [path-to-skel]]

DESCRIPTION

   mkhomedir_helper is a helper program for the pam_mkhomedir module that creates home

   directories and populates them with contents of the specified skel directory.

   The default value of umask is 0022 and the default value of path-to-skel is /etc/skel.

   The helper is separated from the module to not require direct access from login SELinux

   domains to the contents of user home directories. The SELinux domain transition happens

   when the module is executing the mkhomedir_helper.

   The helper never touches home directories if they already exist.
