Rocky Enterprise Linux 9.2 Manual Pages on command 'needrestart.1'

$ man needrestart.1

NEEDRESTART(1)   User Commands   NEEDRESTART(1)

NAME

   needrestart - needrestart

DESCRIPTION

   needrestart checks which daemons need to be restarted after library upgrades.

USAGE

   Usage:

       needrestart [-(v|q)] [-n] [-c <cfg>] [-r <mode>] [-f <fe>] [-u <ui>] [-(b|p)] [-kl]

   -v   be more verbose

   -q   be quiet

   -m <mode>

       set level of technical details

    e   (e)asy mode

    a   (a)dvanced mode

   -n   set default answer to 'no'

   -c <cfg>

       config filename

   -r <mode>

       set restart mode

    l   (l)ist only

    i   (i)nteractive restart

    a   (a)utomatically restart

       ATTENTION: If needrestart is configured to run in interactive mode but is run non-

interactive (i.e. unattended-upgrades) it will fallback to list only mode.

-b   enable batch mode

-p   nagios plugin mode: makes output and exit codes nagios compatible

-f <fe>

    override debconf(7) frontend, sets the DEBIAN_FRONTEND environment variable to <fe>

-t <seconds>

    When checking running interpreter processes, allow process start times that are close to timestamps of files the interpreter uses, within this tolerance (default 2). The default value of 2 seconds is best for checks of Linux hosts, on which sys?tem limitations prevent more accurate measurements of process start times. Values higher than 0 should prevent false positives yet may in extreme cases cause false negatives; values higher than 2 should not be necessary.

-u <ui>

    use preferred UI package (-u ? shows available packages)

By using one of the following options only the specified checks are performed:

-k   check for obsolete kernel

-l   check for obsolete libraries

ENVIRONMENT

The following environment variables can be used to override the config file options. Com?mand line parameters do always supersede them.

NEEDRESTART_MODE

    Change the configured restart mode (see also the -r parameter): (l)ist only, (i)nteractive or (a)utomatically

When used with apt-get(8) needrestart supports the following additional environment vari?ables:

DEBIAN_FRONTEND

    The debconf(7) frontend to use, can also set using the -f parameter.

NEEDRESTART_SUSPEND

    If set to a non-empty value the apt-get(8) hook will not run needrestart after in?stalling or updating packages.
