Rocky Enterprise Linux 9.2 Manual Pages on command 'npm-unpublish.1'

$ man npm-unpublish.1

NAME

    npm-unpublish - Remove a package from the registry

Synopsis

    To learn more about how the npm registry treats unpublish, see our <a

    href="https://docs.npmjs.com/policies/unpublish" target="_blank" rel="noopener norefer?

    rer"> unpublish policies

Unpublishing a single version of a package

      npm unpublish [<@scope>/]<pkg>@<version>

Unpublishing an entire package

      npm unpublish [<@scope>/]<pkg> --force

Warning

    Consider using the npm help deprecate command instead, if your intent is to encourage

    users to upgrade, or if you no longer want to maintain a package.

Description

    This removes a package version from the registry, deleting its entry and removing the tar?

    ball.

    The npm registry will return an error if you are not npm help logged in.

    If you do not specify a version or if you remove all of a package's versions then the reg?

    istry will remove the root package entry entirely.

    Even if you unpublish a package version, that specific name and version combination can

    never be reused. In order to publish the package again, you must use a new version number.

    If you unpublish the entire package, you may not publish any new versions of that package

until 24 hours have passed.

Configuration

<!-- AUTOGENERATED CONFIG DESCRIPTIONS START --> <!-- automatically generated, do not edit

manually --> <!-- see lib/utils/config/definitions.js -->

dry-run

? Default: false

? Type: Boolean

Indicates that you don't want npm to make any changes and that it should only report what

it would have done. This can be passed into any of the commands that modify your local in?

stallation, eg, install, update, dedupe, uninstall, as well as pack and publish.

Note: This is NOT honored by other network related commands, eg dist-tags, owner, etc.

<!-- automatically generated, do not edit manually --> <!-- see lib/utils/config/defini?

tions.js -->

force

? Default: false

? Type: Boolean

Removes various protections against unfortunate side effects, common mistakes, unnecessary

performance degradation, and malicious input.

? Allow clobbering non-npm files in global installs.

? Allow the npm version command to work on an unclean git repository.

? Allow deleting the cache folder with npm cache clean.

? Allow installing packages that have an engines declaration requiring a different version

  of npm.

? Allow installing packages that have an engines declaration requiring a different version

  of node, even if --engine-strict is enabled.

? Allow npm audit fix to install modules outside your stated dependency range (including

  SemVer-major changes).

? Allow unpublishing all versions of a published package.

? Allow conflicting peerDependencies to be installed in the root project.

? Implicitly set --yes during npm init.

? Allow clobbering existing values in npm pkg

If you don't have a clear idea of what you want to do, it is strongly recommended that you

do not use this option! <!-- automatically generated, do not edit manually --> <!-- see

lib/utils/config/definitions.js -->

workspace

? Default:

? Type: String (can be set multiple times)

Enable running a command in the context of the configured workspaces of the current

project while filtering by running only the workspaces defined by this configuration op?

tion.

Valid values for the workspace config are either:

? Workspace names

? Path to a workspace directory

? Path to a parent workspace directory (will result in selecting all workspaces within

  that folder)

When set for the npm init command, this may be set to the folder of a workspace which does

not yet exist, to create the folder and set it up as a brand new workspace within the

project.

This value is not exported to the environment for child processes. <!-- automatically

generated, do not edit manually --> <!-- see lib/utils/config/definitions.js -->

workspaces

? Default: null

? Type: null or Boolean

Set to true to run the command in the context of all configured workspaces.

Explicitly setting this to false will cause commands like install to ignore workspaces al?

together. When not set explicitly:

? Commands that operate on the node_modules tree (install, update, etc.) will link

  workspaces into the node_modules folder. - Commands that do other things (test, exec,

  publish, etc.) will operate on the root project, unless one or more workspaces are spec?

  ified in the workspace config.

This value is not exported to the environment for child processes. <!-- automatically

generated, do not edit manually --> <!-- see lib/utils/config/definitions.js -->

<!-- AUTOGENERATED CONFIG DESCRIPTIONS END -->
