$ man perlhaiku.1

PERLHAIKU(1)   Perl Programmers Reference Guide   PERLHAIKU(1)

NAME

   perlhaiku - Perl version 5.10+ on Haiku

DESCRIPTION

   This file contains instructions how to build Perl for Haiku and lists known problems.

BUILD AND INSTALL

   The build procedure is completely standard:

   ./Configure -de

   make

   make install

   Make perl executable and create a symlink for libperl:

   chmod a+x /boot/common/bin/perl

   cd /boot/common/lib; ln -s perl5/5.34.0/BePC-haiku/CORE/libperl.so .

   Replace 5.34.0 with your respective version of Perl.

KNOWN PROBLEMS

The following problems are encountered with Haiku revision 28311:

? Perl cannot be compiled with threading support ATM.

? The cpan/Socket/t/socketpair.t test fails. More precisely: the subtests using datagram sockets fail. Unix datagram sockets aren't implemented in Haiku yet.

? A subtest of the cpan/Sys-Syslog/t/syslog.t test fails. This is due to Haiku not implementing /dev/log support yet.

? The tests dist/Net-Ping/t/450_service.t and dist/Net-Ping/t/510_ping_udp.t fail. This is due to bugs in Haiku's network stack implementation.

CONTACT

For Haiku specific problems contact the HaikuPorts developers:

<http://ports.haiku-files.org/>

The initial Haiku port was done by Ingo Weinhold <ingo_weinhold@gmx.de>.
