Rocky Enterprise Linux 9.2 Manual Pages on command 'podman-mount.1'

$ man podman-mount.1

podman-mount(1)()   podman-mount(1)()

NAME

   podman-mount - Mount a working container's root filesystem

SYNOPSIS

   podman mount [options] [container ...]

   podman container mount [options] [container ...]

DESCRIPTION

   Mounts the specified containers' root file system in a location which can be accessed from

   the host, and returns its location.

   If you execute the command without any arguments, Podman will list all of the currently

   mounted containers, including external containers. External containers are containers in

   container/storage by tools other then Podman. For example Buildah and CRI-O.

   Rootless mode only supports mounting VFS driver, unless you enter the user namespace via

   the podman unshare command. All other storage drivers will fail to mount.

RETURN VALUE

   The location of the mounted file system. On error an empty string and errno is returned.

OPTIONS

 --all, -a

   Mount all podman containers. (External containers will not be mounted)

 --format=format

   Print the mounted containers in specified format (json).

 --latest, -l

   Instead of providing the container name or ID, use the last created container. If you use   *Page 1/2*

methods other than Podman to run containers such as CRI-O, the last started container

could be from either of those methods. (This option is not available with the remote Pod?

man client)

  --notruncate

Do not truncate IDs in output.

EXAMPLE

podman mount c831414b10a3

/var/lib/containers/storage/overlay/f3ac502d97b5681989dff84dfedc8354239bcecbdc2692f9a639f4e080a02364/merged

podman mount

c831414b10a3

/var/lib/containers/storage/overlay/f3ac502d97b5681989dff84dfedc8354239bcecbdc2692f9a639f4e080a02364/merged

a7060253093b
