Rocky Enterprise Linux 9.2 Manual Pages on command 'podman-network-disconnect.1'

$ man podman-network-disconnect.1

podman-network-disconnect(1)()   podman-network-disconnect(1)()

NAME

    podman-network-disconnect - Disconnect a container from a network

SYNOPSIS

    podman network disconnect [options] network container

DESCRIPTION

    Disconnects a container from a network. A container can be disconnected from a network by

    name or by ID. If all networks are disconnected from the container, it will behave like a

    container created with --network=none and it will longer have network connectivity until a

    network is connected again.

OPTIONS

  --force, -f

    Force the container to disconnect from a network

EXAMPLE

    Disconnect a container named web from a network called test.

        podman network disconnect test web
