$ man psfxtable.1

PSFXTABLE(1)   General Commands Manual   PSFXTABLE(1)

NAME

   psfxtable - handle Unicode character tables for console fonts

SYNOPSIS

   psfxtable [-i infont] [-o outfont] [-it intable] [-ot outtable] [-nt]

DESCRIPTION

   psfxtable handles the embedded Unicode character table for .psf format console fonts. It

   reads a font and possibly a table and writes a font and/or a table.   psfaddtable(1), ps?

   fgettable(1) and psfstriptable(1) are links to it.

   Each of the filenames infont, outfont, intable, and outtable may be replaced by a single

   dash (-), in which case standard input or standard output is used. If no -i option is

   given, the font is read from standard input. If no -it or -o or -ot option is given, no

   input table is read or no output font or output table is written.

   By default the output font (if any) will have a Unicode table when either the input font

   has one, or an explicit table (which overrides an input font table) has been provided.

   The option -nt causes output of a font without table. When outfont is requested it will

   get a psf1 header when infont has a psf1 header and intable does not have sequences and a

   psf2 header otherwise.
