## Linux Ubuntu 22.4.5 Manual Pages on command 'qemu-qmp-ref.7'

#### \$ man qemu-qmp-ref.7

QEMU-QMP-REF.7(7)

QEMU-QMP-REF.7(7)

NAME

qemu-qmp-ref - QEMU QMP Reference Manual

#### **DESCRIPTION**

#### Introduction

This document describes all commands currently supported by QMP.

Most of the time their usage is exactly the same as in the user Monitor, this means that any other document which also describe commands (the manpage, QEMU's manual, etc) can and should be consulted.

QMP has two types of commands: regular and query commands. Regular commands usually change the Virtual Machine's state someway, while query commands just return information. The sections below are divided accordingly.

It's important to observe that all communication examples are formatted in a reader-friendly way, so that they're easier to understand. However, in real protocol usage, they're emitted as a single line.

Also, the following notation is used to denote data flow:

#### Example:

- -> data issued by the Client
- <- Server data response

Please, refer to the QMP specification (docs/interop/qmp-spec.txt) for detailed information on the Server command and response formats.

Stability Considerations Page 1/325

The current QMP command set (described in this file) may be useful for a number of use cases, however it's limited and several commands have bad defined semantics, specially with regard to command completion.

These problems are going to be solved incrementally in the next QEMU releases and we're going to establish a deprecation policy for badly defined commands.

If you're planning to adopt QMP, please observe the following:

- The deprecation policy will take effect and be documented soon, please check
  the documentation of each used command as soon as a new release of QEMU is
  available
- 2. DO NOT rely on anything which is not explicit documented
- Errors, in special, are not documented. Applications should NOT check for specific errors classes or data (it's strongly recommended to only check for the "error" key)

QMP errors

QapiErrorClass (Enum)

**QEMU** error classes

Values:

"GenericError"

this is used for errors that don't require a specific error class. This should be the default case for most errors

"CommandNotFound"

the requested command has not been found

"DeviceNotActive"

a device has failed to be become active

"DeviceNotFound"

the requested device has not been found

"KVMMissingCap"

the requested operation can't be fulfilled because a required KVM capability is missing

Since: 1.2

Common data types

IoOperationType (Enum)

Values:
"read"
read operation
"write"
write operation
Since: 2.1
OnOffAuto (Enum)
An enumeration of three options: on, off, and auto
Values:
"auto"
QEMU selects the value between on and off
"on"
Enabled
"off"
Disabled
Since: 2.2
OnOffSplit (Enum)
An enumeration of three values: on, off, and split
Values:
"on"
Enabled
"off"
Disabled
"split"
Mixed
Since: 2.6
String (Object)
A fat type wrapping 'str', to be embedded in lists.
Members:
"str: string"
Not documented
Since: 1.2

StrOrNull (Alternate)

Page 3/325

This is a string value or the explicit lack of a string (null pointer in C). Intended for cases when 'optional absent' already has a different meaning. Members: "s: string" the string value "n: null" no string value Since: 2.10 OffAutoPCIBAR (Enum) An enumeration of options for specifying a PCI BAR Values: "off" The specified feature is disabled "auto" The PCI BAR for the feature is automatically selected "bar0" PCI BAR0 is used for the feature "bar1" PCI BAR1 is used for the feature "bar2" PCI BAR2 is used for the feature "bar3" PCI BAR3 is used for the feature "bar4" PCI BAR4 is used for the feature "bar5" PCI BAR5 is used for the feature Since: 2.12 PCIELinkSpeed (Enum) An enumeration of PCIe link speeds in units of GT/s Values: "2 5"

Page 4/325

```
5 5.0GT/s
  8 8.0GT/s
  16 16.0GT/s
  Since: 4.0
  PCIELinkWidth (Enum)
  An enumeration of PCIe link width
  Values:
  1 x1
  2 x2
  4 x4
  8 x8
  12 x12
  16 x16
  32 x32
  Since: 4.0
Socket data types
  NetworkAddressFamily (Enum)
  The network address family
  Values:
  "ipv4"
    IPV4 family
  "ipv6"
    IPV6 family
  "unix"
    unix socket
  "vsock"
    vsock family (since 2.8)
  "unknown"
    otherwise
  Since: 2.1
  InetSocketAddressBase (Object)
  Members:
```

"host: string"

```
host part of the address
"port: string"
  port part of the address
InetSocketAddress (Object)
Captures a socket address or address range in the Internet namespace.
Members:
"numeric: boolean" (optional)
  true if the host/port are guaranteed to be numeric, false if name resolution
  should be attempted. Defaults to false. (Since 2.9)
"to: int" (optional)
  If present, this is range of possible addresses, with port between "port" and
  "to".
"ipv4: boolean" (optional)
  whether to accept IPv4 addresses, default try both IPv4 and IPv6
"ipv6: boolean" (optional)
  whether to accept IPv6 addresses, default try both IPv4 and IPv6
"keep-alive: boolean" (optional)
  enable keep-alive when connecting to this socket. Not supported for passive
  sockets. (Since 4.2)
The members of "InetSocketAddressBase"
Since: 1.3
UnixSocketAddress (Object)
Captures a socket address in the local ("Unix socket") namespace.
Members:
"path: string"
  filesystem path to use
Since: 1.3
VsockSocketAddress (Object)
Captures a socket address in the vsock namespace.
Members:
"cid: string"
  unique host identifier
```

"port: string"

```
port
```

Note: string types are used to allow for possible future hostname or service resolution support.

Since: 2.8

SocketAddressLegacy (Object)

Captures the address of a socket, which could also be a named file descriptor

Members:

"type"

One of "inet", "unix", "vsock", "fd"

"data: InetSocketAddress" when "type" is "inet"

"data: UnixSocketAddress" when "type" is "unix"

"data: VsockSocketAddress" when "type" is "vsock"

"data: String" when "type" is "fd"

Note: This type is deprecated in favor of SocketAddress. The difference between SocketAddressLegacy and SocketAddress is that the latter is a flat union rather than a simple union. Flat is nicer because it avoids nesting on the wire, i.e. that form has fewer {}.

Since: 1.3

SocketAddressType (Enum)

Available SocketAddress types

Values:

"inet"

Internet address

"unix"

Unix domain socket

"vsock"

VMCI address

"fd"

decimal is for file descriptor number, otherwise a file descriptor name. Named file descriptors are permitted in monitor commands, in combination with the 'getfd' command. Decimal file descriptors are permitted at startup or other contexts where no monitor context is active.

Since: 2.9 Page 7/325

SocketAddress (Object) Captures the address of a socket, which could also be a named file descriptor Members: "type: SocketAddressType" Transport type The members of "InetSocketAddress" when "type" is "inet" The members of "UnixSocketAddress" when "type" is "unix" The members of "VsockSocketAddress" when "type" is "vsock" The members of "String" when "type" is "fd" Since: 2.9 VM run state RunState (Enum) An enumeration of VM run states. Values: "debug" QEMU is running on a debugger "finish-migrate" guest is paused to finish the migration process "inmigrate" guest is paused waiting for an incoming migration. Note that this state does not tell whether the machine will start at the end of the migration. This depends on the command-line -S option and any invocation of 'stop' or 'cont' that has happened since QEMU was started. "internal-error" An internal error that prevents further guest execution has occurred "io-error" the last IOP has failed and the device is configured to pause on I/O errors "paused" guest has been paused via the 'stop' command "postmigrate" guest is paused following a successful 'migrate' "prelaunch"

QEMU was started with -S and guest has not started

```
"restore-vm"
  guest is paused to restore VM state
"running"
  guest is actively running
"save-vm"
  guest is paused to save the VM state
"shutdown"
  guest is shut down (and -no-shutdown is in use)
"suspended"
  guest is suspended (ACPI S3)
"watchdog"
  the watchdog action is configured to pause and has been triggered
"guest-panicked"
  guest has been panicked as a result of guest OS panic
"colo"
  guest is paused to save/restore VM state under colo checkpoint, VM can not get
  into this state unless colo capability is enabled for migration. (since 2.8)
"preconfig"
  QEMU is paused before board specific init callback is executed. The state is
  reachable only if the --preconfig CLI option is used. (Since 3.0)
ShutdownCause (Enum)
An enumeration of reasons for a Shutdown.
Values:
"none"
  No shutdown request pending
"host-error"
  An error prevents further use of guest
"host-qmp-quit"
  Reaction to the QMP command 'quit'
"host-qmp-system-reset"
  Reaction to the QMP command 'system_reset'
"host-signal"
```

```
"host-ui"
  Reaction to a UI event, like window close
"guest-shutdown"
  Guest shutdown/suspend request, via ACPI or other hardware-specific means
"guest-reset"
  Guest reset request, and command line turns that into a shutdown
"guest-panic"
  Guest panicked, and command line turns that into a shutdown
"subsystem-reset"
  Partial guest reset that does not trigger QMP events and ignores --no-reboot.
  This is useful for sanitizing hypercalls on s390 that are used during
  kexec/kdump/boot
StatusInfo (Object)
Information about VCPU run state
Members:
"running: boolean"
  true if all VCPUs are runnable, false if not runnable
"singlestep: boolean"
  true if VCPUs are in single-step mode
"status: RunState"
  the virtual machine "RunState"
Since: 0.14.0
Notes: "singlestep" is enabled through the GDB stub
query-status (Command) Query the run status of all VCPUs
Returns: "StatusInfo" reflecting all VCPUs
Since: 0.14.0
Example:
    -> { "execute": "query-status" }
     <- { "return": { "running": true,
               "singlestep": false,
               "status": "running" } }
SHUTDOWN (Event) Emitted when the virtual machine has shut down, indicating that
```

qemu is about to exit.

Page 10/325

```
Arguments:
"guest: boolean"
  If true, the shutdown was triggered by a guest request (such as a guest-
  initiated ACPI shutdown request or other hardware-specific action) rather than
  a host request (such as sending qemu a SIGINT). (since 2.10)
"reason: ShutdownCause"
  The "ShutdownCause" which resulted in the SHUTDOWN. (since 4.0)
Note: If the command-line option "-no-shutdown" has been specified, qemu will not
exit, and a STOP event will eventually follow the SHUTDOWN event
Since: 0.12.0
Example:
    <- { "event": "SHUTDOWN", "data": { "guest": true },
        "timestamp": { "seconds": 1267040730, "microseconds": 682951 } }
POWERDOWN (Event) Emitted when the virtual machine is powered down through the
power control system, such as via ACPI.
Since: 0.12.0
Example:
    <- { "event": "POWERDOWN",
        "timestamp": { "seconds": 1267040730, "microseconds": 682951 } }
RESET (Event) Emitted when the virtual machine is reset
Arguments:
"guest: boolean"
  If true, the reset was triggered by a guest request (such as a guest-initiated
  ACPI reboot request or other hardware-specific action) rather than a host
  request (such as the QMP command system_reset). (since 2.10)
"reason: ShutdownCause"
  The "ShutdownCause" of the RESET. (since 4.0)
Since: 0.12.0
Example:
    <- { "event": "RESET", "data": { "guest": false },
        "timestamp": { "seconds": 1267041653, "microseconds": 9518 } }
STOP (Event) Emitted when the virtual machine is stopped
```

Since: 0.12.0 Page 11/325

```
Example:
    <- { "event": "STOP",
       "timestamp": { "seconds": 1267041730, "microseconds": 281295 } }
RESUME (Event) Emitted when the virtual machine resumes execution
Since: 0.12.0
Example:
    <- { "event": "RESUME",
       "timestamp": { "seconds": 1271770767, "microseconds": 582542 } }
SUSPEND (Event) Emitted when guest enters a hardware suspension state, for
example, S3 state, which is sometimes called standby state
Since: 1.1
Example:
    <- { "event": "SUSPEND",
       "timestamp": { "seconds": 1344456160, "microseconds": 309119 } }
SUSPEND_DISK (Event) Emitted when guest enters a hardware suspension state with
data saved on disk, for example, S4 state, which is sometimes called hibernate
state
Note: QEMU shuts down (similar to event "SHUTDOWN") when entering this state
Since: 1.2
Example:
    <- { "event": "SUSPEND_DISK",
         "timestamp": { "seconds": 1344456160, "microseconds": 309119 } }
WAKEUP (Event) Emitted when the guest has woken up from suspend state and is
running
Since: 1.1
Example:
    <- { "event": "WAKEUP",
       "timestamp": { "seconds": 1344522075, "microseconds": 745528 } }
WATCHDOG (Event) Emitted when the watchdog device's timer is expired
Arguments:
"action: WatchdogAction"
  action that has been taken
```

Note: If action is "reset", "shutdown", or "pause" the WATCHDOG event is followed

```
respectively by the RESET, SHUTDOWN, or STOP events
Note: This event is rate-limited.
Since: 0.13.0
Example:
     <- { "event": "WATCHDOG",
        "data": { "action": "reset" },
        "timestamp": { "seconds": 1267061043, "microseconds": 959568 } }
WatchdogAction (Enum)
An enumeration of the actions taken when the watchdog device's timer is expired
Values:
"reset"
  system resets
"shutdown"
  system shutdown, note that it is similar to "powerdown", which tries to set to
  system status and notify guest
"poweroff"
  system poweroff, the emulator program exits
"pause"
  system pauses, similar to "stop"
"debug"
  system enters debug state
"none"
  nothing is done
"inject-nmi"
  a non-maskable interrupt is injected into the first VCPU (all VCPUS on x86)
  (since 2.4)
Since: 2.1
watchdog-set-action (Command) Set watchdog action
Arguments:
"action: WatchdogAction"
  Not documented
Since: 2.11
```

```
Arguments:
"action: GuestPanicAction"
  action that has been taken, currently always "pause"
"info: GuestPanicInformation" (optional)
  information about a panic (since 2.9)
Since: 1.5
Example:
    <- { "event": "GUEST_PANICKED",
        "data": { "action": "pause" } }
GuestPanicAction (Enum)
An enumeration of the actions taken when guest OS panic is detected
Values:
"pause"
  system pauses
"poweroff"
  Not documented
Since: 2.1 (poweroff since 2.8)
GuestPanicInformationType (Enum)
An enumeration of the guest panic information types
Values:
"hyper-v"
  hyper-v guest panic information type
"s390"
  s390 guest panic information type (Since: 2.12)
Since: 2.9
GuestPanicInformation (Object)
Information about a guest panic
Members:
"type: GuestPanicInformationType"
  Crash type that defines the hypervisor specific information
The members of "GuestPanicInformationHyperV" when "type" is "hyper-v"
The members of "GuestPanicInformationS390" when "type" is "s390"
```

Since: 2.9 Page 14/325

GuestPanicInformationHyperV (Object) Hyper-V specific guest panic information (HV crash MSRs) Members: "arg1: int" Not documented "arg2: int" Not documented "arg3: int" Not documented "arg4: int" Not documented "arg5: int" Not documented Since: 2.9 S390CrashReason (Enum) Reason why the CPU is in a crashed state. Values: "unknown" no crash reason was set "disabled-wait" the CPU has entered a disabled wait state "extint-loop" clock comparator or cpu timer interrupt with new PSW enabled for external interrupts "pgmint-loop" program interrupt with BAD new PSW "opint-loop" operation exception interrupt with invalid code at the program interrupt new **PSW** Since: 2.12 GuestPanicInformationS390 (Object) S390 specific guest panic information (PSW)

Members:

Page 15/325

```
"core: int"
     core id of the CPU that crashed
  "psw-mask: int"
     control fields of guest PSW
  "psw-addr: int"
     guest instruction address
  "reason: S390CrashReason"
     guest crash reason
  Since: 2.12
Cryptography
  QCryptoTLSCredsEndpoint (Enum)
  The type of network endpoint that will be using the credentials. Most types of
  credential require different setup / structures depending on whether they will be
  used in a server versus a client.
  Values:
  "client"
     the network endpoint is acting as the client
  "server"
     the network endpoint is acting as the server
  Since: 2.5
  QCryptoSecretFormat (Enum)
  The data format that the secret is provided in
  Values:
  "raw"
     raw bytes. When encoded in JSON only valid UTF-8 sequences can be used
  "base64"
     arbitrary base64 encoded binary data
  Since: 2.6
  QCryptoHashAlgorithm (Enum)
  The supported algorithms for computing content digests
  Values:
  "md5"
```

MD5. Should not be used in any new code, legacy compat only

```
"sha1"
  SHA-1. Should not be used in any new code, legacy compat only
"sha224"
  SHA-224. (since 2.7)
"sha256"
  SHA-256. Current recommended strong hash.
"sha384"
  SHA-384. (since 2.7)
"sha512"
  SHA-512. (since 2.7)
"ripemd160"
  RIPEMD-160. (since 2.7)
Since: 2.6
QCryptoCipherAlgorithm (Enum)
The supported algorithms for content encryption ciphers
Values:
"aes-128"
  AES with 128 bit / 16 byte keys
"aes-192"
  AES with 192 bit / 24 byte keys
"aes-256"
  AES with 256 bit / 32 byte keys
"des-rfb"
  RFB specific variant of single DES. Do not use except in VNC.
"3des"
  3DES(EDE) with 192 bit / 24 byte keys (since 2.9)
"cast5-128"
  Cast5 with 128 bit / 16 byte keys
"serpent-128"
  Serpent with 128 bit / 16 byte keys
"serpent-192"
  Serpent with 192 bit / 24 byte keys
```

"serpent-256"

Page 17/325

```
Serpent with 256 bit / 32 byte keys
"twofish-128"
  Twofish with 128 bit / 16 byte keys
"twofish-192"
  Twofish with 192 bit / 24 byte keys
"twofish-256"
  Twofish with 256 bit / 32 byte keys
Since: 2.6
QCryptoCipherMode (Enum)
The supported modes for content encryption ciphers
Values:
"ecb"
  Electronic Code Book
"cbc"
  Cipher Block Chaining
"xts"
  XEX with tweaked code book and ciphertext stealing
"ctr"
  Counter (Since 2.8)
Since: 2.6
QCryptoIVGenAlgorithm (Enum)
The supported algorithms for generating initialization vectors for full disk
encryption. The 'plain' generator should not be used for disks with sector numbers
larger than 2^32, except where compatibility with pre-existing Linux dm-crypt
volumes is required.
Values:
"plain"
  64-bit sector number truncated to 32-bits
"plain64"
  64-bit sector number
"essiv"
  64-bit sector number encrypted with a hash of the encryption key
```

Since: 2.6 Page 18/325

QCryptoBlockFormat (Enum) The supported full disk encryption formats Values: "qcow" QCow/QCow2 built-in AES-CBC encryption. Use only for liberating data from old images. "luks" LUKS encryption format. Recommended for new images Since: 2.6 QCryptoBlockOptionsBase (Object) The common options that apply to all full disk encryption formats Members: "format: QCryptoBlockFormat" the encryption format Since: 2.6 QCryptoBlockOptionsQCow (Object) The options that apply to QCow/QCow2 AES-CBC encryption format Members: "key-secret: string" (optional) the ID of a QCryptoSecret object providing the decryption key. Mandatory except when probing image for metadata only. Since: 2.6 QCryptoBlockOptionsLUKS (Object) The options that apply to LUKS encryption format Members: "key-secret: string" (optional) the ID of a QCryptoSecret object providing the decryption key. Mandatory except when probing image for metadata only. Since: 2.6

QCryptoBlockCreateOptionsLUKS (Object)

The options that apply to LUKS encryption format initialization

Members:

"cipher-alg: QCryptoCipherAlgorithm" (optional)

the cipher algorithm for data encryption Currently defaults to 'aes-256'.

"cipher-mode: QCryptoCipherMode" (optional)

the cipher mode for data encryption Currently defaults to 'xts'

"ivgen-alg: QCryptoIVGenAlgorithm" (optional)

the initialization vector generator Currently defaults to 'plain64'

"ivgen-hash-alg: QCryptoHashAlgorithm" (optional)

the initialization vector generator hash Currently defaults to 'sha256'

"hash-alg: QCryptoHashAlgorithm" (optional)

the master key hash algorithm Currently defaults to 'sha256'

"iter-time: int" (optional)

number of milliseconds to spend in PBKDF passphrase processing. Currently

defaults to 2000. (since 2.8)

The members of "QCryptoBlockOptionsLUKS"

Since: 2.6

QCryptoBlockOpenOptions (Object)

The options that are available for all encryption formats when opening an existing

volume

Members:

The members of "QCryptoBlockOptionsBase"

The members of "QCryptoBlockOptionsQCow" when "format" is "qcow"

The members of "QCryptoBlockOptionsLUKS" when "format" is "luks"

Since: 2.6

QCryptoBlockCreateOptions (Object)

The options that are available for all encryption formats when initializing a new

volume

Members:

The members of "QCryptoBlockOptionsBase"

The members of "QCryptoBlockOptionsQCow" when "format" is "qcow"

The members of "QCryptoBlockCreateOptionsLUKS" when "format" is "luks"

Since: 2.6

QCryptoBlockInfoBase (Object)

The common information that applies to all full disk encryption formats

Members: Page 20/325

"format: QCryptoBlockFormat"

the encryption format

Since: 2.7

QCryptoBlockInfoLUKSSlot (Object)

Information about the LUKS block encryption key slot options

Members:

"active: boolean"

whether the key slot is currently in use

"key-offset: int"

offset to the key material in bytes

"iters: int" (optional)

number of PBKDF2 iterations for key material

"stripes: int" (optional)

number of stripes for splitting key material

Since: 2.7

QCryptoBlockInfoLUKS (Object)

Information about the LUKS block encryption options

Members:

"cipher-alg: QCryptoCipherAlgorithm"

the cipher algorithm for data encryption

"cipher-mode: QCryptoCipherMode"

the cipher mode for data encryption

"ivgen-alg: QCryptoIVGenAlgorithm"

the initialization vector generator

"ivgen-hash-alg: QCryptoHashAlgorithm" (optional)

the initialization vector generator hash

"hash-alg: QCryptoHashAlgorithm"

the master key hash algorithm

"payload-offset: int"

offset to the payload data in bytes

"master-key-iters: int"

number of PBKDF2 iterations for key material

"uuid: string"

Page 21/325

```
unique identifier for the volume
  "slots: array of QCryptoBlockInfoLUKSSlot"
     information about each key slot
  Since: 2.7
  QCryptoBlockInfo (Object)
  Information about the block encryption options
  Members:
  The members of "QCryptoBlockInfoBase"
  The members of "QCryptoBlockInfoLUKS" when "format" is "luks"
  Since: 2.7
Block devices
  Block core (VM unrelated)
  Background jobs
  JobType (Enum)
  Type of a background job.
  Values:
  "commit"
     block commit job type, see "block-commit"
  "stream"
     block stream job type, see "block-stream"
  "mirror"
     drive mirror job type, see "drive-mirror"
  "backup"
     drive backup job type, see "drive-backup"
  "create"
     image creation job type, see "blockdev-create" (since 3.0)
  Since: 1.7
  JobStatus (Enum)
  Indicates the present state of a given job in its lifetime.
  Values:
  "undefined"
     Erroneous, default state. Should not ever be visible.
```

"created"

Page 22/325

The job has been created, but not yet started.

## "running"

The job is currently running.

#### "paused"

The job is running, but paused. The pause may be requested by either the QMP user or by internal processes.

## "ready"

The job is running, but is ready for the user to signal completion. This is used for long-running jobs like mirror that are designed to run indefinitely.

#### "standby"

The job is ready, but paused. This is nearly identical to "paused". The job may return to "ready" or otherwise be canceled.

#### "waiting"

The job is waiting for other jobs in the transaction to converge to the waiting state. This status will likely not be visible for the last job in a transaction.

## "pending"

The job has finished its work, but has finalization steps that it needs to make prior to completing. These changes will require manual intervention via "job-finalize" if auto-finalize was set to false. These pending changes may still fail.

## "aborting"

The job is in the process of being aborted, and will finish with an error. The job will afterwards report that it is "concluded". This status may not be visible to the management process.

#### "concluded"

The job has finished all work. If auto-dismiss was set to false, the job will remain in the query list until it is dismissed via "job-dismiss".

#### "null"

The job is in the process of being dismantled. This state should not ever be visible externally.

#### Since: 2.12

JobVerb (Enum) Page 23/325

```
Represents command verbs that can be applied to a job.
Values:
"cancel"
  see "job-cancel"
"pause"
  see "job-pause"
"resume"
  see "job-resume"
"set-speed"
  see "block-job-set-speed"
"complete"
  see "job-complete"
"dismiss"
  see "job-dismiss"
"finalize"
  see "job-finalize"
Since: 2.12
JOB_STATUS_CHANGE (Event) Emitted when a job transitions to a different status.
Arguments:
"id: string"
  The job identifier
"status: JobStatus"
  The new job status
Since: 3.0
job-pause (Command) Pause an active job.
This command returns immediately after marking the active job for pausing. Pausing
an already paused job is an error.
The job will pause as soon as possible, which means transitioning into the PAUSED
state if it was RUNNING, or into STANDBY if it was READY. The corresponding
JOB_STATUS_CHANGE event will be emitted.
Cancelling a paused job automatically resumes it.
Arguments:
```

"id: string"

Page 24/325

The job identifier. Since: 3.0 job-resume (Command) Resume a paused job. This command returns immediately after resuming a paused job. Resuming an already running job is an error. "id": The job identifier. Arguments: "id: string" Not documented Since: 3.0 job-cancel (Command) Instruct an active background job to cancel at the next opportunity. This command returns immediately after marking the active job for cancellation. The job will cancel as soon as possible and then emit a JOB\_STATUS\_CHANGE event. Usually, the status will change to ABORTING, but it is possible that a job successfully completes (e.g. because it was almost done and there was no opportunity to cancel earlier than completing the job) and transitions to PENDING instead. Arguments: "id: string" The job identifier. Since: 3.0 job-complete (Command) Manually trigger completion of an active job in the READY state. Arguments: "id: string" The job identifier. Since: 3.0 job-dismiss (Command) Deletes a job that is in the CONCLUDED state. This command only needs to be run explicitly for jobs that don't have automatic dismiss enabled. This command will refuse to operate on any job that has not yet reached its terminal state, JOB\_STATUS\_CONCLUDED. For jobs that make use of JOB\_READY event,

job-cancel or job-complete will still need to be used as appropriate.

Arguments: "id: string" The job identifier. Since: 3.0 job-finalize (Command) Instructs all jobs in a transaction (or a single job if it is not part of any transaction) to finalize any graph changes and do any necessary cleanup. This command requires that all involved jobs are in the PENDING state. For jobs in a transaction, instructing one job to finalize will force ALL jobs in the transaction to finalize, so it is only necessary to instruct a single member job to finalize. Arguments: "id: string" The identifier of any job in the transaction, or of a job that is not part of any transaction. Since: 3.0 JobInfo (Object) Information about a job. Members: "id: string" The job identifier "type: JobType" The kind of job that is being performed "status: JobStatus" Current job state/status "current-progress: int" Progress made until now. The unit is arbitrary and the value can only meaningfully be used for the ratio of "current-progress" to "total-progress". The value is monotonically increasing. "total-progress: int" Estimated "current-progress" value at the completion of the job. This value can arbitrarily change while the job is running, in both directions.

"error: string" (optional)

If this field is present, the job failed; if it is still missing in the

CONCLUDED state, this indicates successful completion.

The value is a human-readable error message to describe the reason for the job

failure. It should not be parsed by applications.

Since: 3.0

query-jobs (Command) Return information about jobs.

Returns: a list with a "JobInfo" for each active job

Since: 3.0

SnapshotInfo (Object)

Members:

"id: string"

unique snapshot id

"name: string"

user chosen name

"vm-state-size: int"

size of the VM state

"date-sec: int"

UTC date of the snapshot in seconds

"date-nsec: int"

fractional part in nano seconds to be used with date-sec

"vm-clock-sec: int"

VM clock relative to boot in seconds

"vm-clock-nsec: int"

fractional part in nano seconds to be used with vm-clock-sec

Since: 1.3

ImageInfoSpecificQCow2EncryptionBase (Object)

Members:

"format: BlockdevQcow2EncryptionFormat"

The encryption format

Since: 2.10

ImageInfoSpecificQCow2Encryption (Object)

Members:

The members of "ImageInfoSpecificQCow2EncryptionBase"

The members of "QCryptoBlockInfoLUKS" when "format" is "luks"

```
Since: 2.10
ImageInfoSpecificQCow2 (Object)
Members:
"compat: string"
  compatibility level
"data-file: string" (optional)
  the filename of the external data file that is stored in the image and used as
  a default for opening the image (since: 4.0)
"data-file-raw: boolean" (optional)
  True if the external data file must stay valid as a standalone (read-only) raw
  image without looking at qcow2 metadata (since: 4.0)
"lazy-refcounts: boolean" (optional)
  on or off; only valid for compat >= 1.1
"corrupt: boolean" (optional)
  true if the image has been marked corrupt; only valid for compat >= 1.1 (since
  2.2)
"refcount-bits: int"
  width of a refcount entry in bits (since 2.3)
"encrypt: ImageInfoSpecificQCow2Encryption" (optional)
  details about encryption parameters; only set if image is encrypted (since
  2.10)
"bitmaps: array of Qcow2BitmapInfo" (optional)
  A list of qcow2 bitmap details (since 4.0)
Since: 1.7
ImageInfoSpecificVmdk (Object)
Members:
"create-type: string"
  The create type of VMDK image
"cid: int"
  Content id of image
"parent-cid: int"
  Parent VMDK image's cid
"extents: array of ImageInfo"
```

# Since: 1.7 ImageInfoSpecific (Object) A discriminated record of image format specific information structures. Members: "type" One of "qcow2", "vmdk", "luks" "data: ImageInfoSpecificQCow2" when "type" is "qcow2" "data: ImageInfoSpecificVmdk" when "type" is "vmdk" "data: QCryptoBlockInfoLUKS" when "type" is "luks" Since: 1.7 ImageInfo (Object) Information about a QEMU image file Members: "filename: string" name of the image file "format: string" format of the image file "virtual-size: int" maximum capacity in bytes of the image "actual-size: int" (optional) actual size on disk in bytes of the image "dirty-flag: boolean" (optional) true if image is not cleanly closed "cluster-size: int" (optional) size of a cluster in bytes "encrypted: boolean" (optional) true if the image is encrypted "compressed: boolean" (optional) true if the image is compressed (Since 1.7) "backing-filename: string" (optional) name of the backing file

"full-backing-filename: string" (optional)

List of extent files

```
full path of the backing file
"backing-filename-format: string" (optional)
  the format of the backing file
"snapshots: array of SnapshotInfo" (optional)
  list of VM snapshots
"backing-image: ImageInfo" (optional)
  info of the backing image (since 1.6)
"format-specific: ImageInfoSpecific" (optional)
  structure supplying additional format-specific information (since 1.7)
Since: 1.3
ImageCheck (Object)
Information about a QEMU image file check
Members:
"filename: string"
  name of the image file checked
"format: string"
  format of the image file checked
"check-errors: int"
  number of unexpected errors occurred during check
"image-end-offset: int" (optional)
  offset (in bytes) where the image ends, this field is present if the driver for
  the image format supports it
"corruptions: int" (optional)
  number of corruptions found during the check if any
"leaks: int" (optional)
  number of leaks found during the check if any
"corruptions-fixed: int" (optional)
  number of corruptions fixed during the check if any
"leaks-fixed: int" (optional)
  number of leaks fixed during the check if any
"total-clusters: int" (optional)
  total number of clusters, this field is present if the driver for the image
```

format supports it Page 30/325

"allocated-clusters: int" (optional) total number of allocated clusters, this field is present if the driver for the image format supports it "fragmented-clusters: int" (optional) total number of fragmented clusters, this field is present if the driver for the image format supports it "compressed-clusters: int" (optional) total number of compressed clusters, this field is present if the driver for the image format supports it Since: 1.4 MapEntry (Object) Mapping information from a virtual block range to a host file range Members: "start: int" the start byte of the mapped virtual range "length: int" the number of bytes of the mapped virtual range "data: boolean" whether the mapped range has data "zero: boolean" whether the virtual blocks are zeroed "depth: int" the depth of the mapping "offset: int" (optional) the offset in file that the virtual sectors are mapped to "filename: string" (optional) filename that is referred to by "offset" Since: 2.6 BlockdevCacheInfo (Object) Cache mode information for a block device Members: "writeback: boolean"

true if writeback mode is enabled

```
"direct: boolean"
  true if the host page cache is bypassed (O_DIRECT)
"no-flush: boolean"
  true if flush requests are ignored for the device
Since: 2.3
BlockDeviceInfo (Object)
Information about the backing device for a block device.
Members:
"file: string"
  the filename of the backing device
"node-name: string" (optional)
  the name of the block driver node (Since 2.0)
"ro: boolean"
  true if the backing device was open read-only
"drv: string"
  the name of the block format used to open the backing device. As of 0.14.0 this
  can be: 'blkdebug', 'bochs', 'cloop', 'cow', 'dmg', 'file', 'file', 'ftp',
  'ftps', 'host cdrom', 'host device', 'http', 'https', 'luks', 'nbd',
  'parallels', 'qcow', 'qcow2', 'raw', 'vdi', 'vmdk', 'vpc', 'vvfat' 2.2:
  'archipelago' added, 'cow' dropped 2.3: 'host_floppy' deprecated 2.5:
  'host_floppy' dropped 2.6: 'luks' added 2.8: 'replication' added, 'tftp'
  dropped 2.9: 'archipelago' dropped
"backing_file: string" (optional)
  the name of the backing file (for copy-on-write)
"backing_file_depth: int"
  number of files in the backing file chain (since: 1.2)
"encrypted: boolean"
  true if the backing device is encrypted
"encryption_key_missing: boolean"
  Deprecated; always false
"detect_zeroes: BlockdevDetectZeroesOptions"
  detect and optimize zero writes (Since 2.1)
```

"bps: int" Page 32/325

```
total throughput limit in bytes per second is specified
"bps_rd: int"
  read throughput limit in bytes per second is specified
"bps_wr: int"
  write throughput limit in bytes per second is specified
"iops: int"
  total I/O operations per second is specified
"iops_rd: int"
  read I/O operations per second is specified
"iops wr: int"
  write I/O operations per second is specified
"image: ImageInfo"
  the info of image used (since: 1.6)
"bps_max: int" (optional)
  total throughput limit during bursts, in bytes (Since 1.7)
"bps_rd_max: int" (optional)
  read throughput limit during bursts, in bytes (Since 1.7)
"bps wr max: int" (optional)
  write throughput limit during bursts, in bytes (Since 1.7)
"iops_max: int" (optional)
  total I/O operations per second during bursts, in bytes (Since 1.7)
"iops_rd_max: int" (optional)
  read I/O operations per second during bursts, in bytes (Since 1.7)
"iops_wr_max: int" (optional)
  write I/O operations per second during bursts, in bytes (Since 1.7)
"bps_max_length: int" (optional)
  maximum length of the "bps_max" burst period, in seconds. (Since 2.6)
"bps_rd_max_length: int" (optional)
  maximum length of the "bps_rd_max" burst period, in seconds. (Since 2.6)
"bps_wr_max_length: int" (optional)
  maximum length of the "bps_wr_max" burst period, in seconds. (Since 2.6)
"iops_max_length: int" (optional)
```

maximum length of the "iops" burst period, in seconds. (Since 2.6)

```
"iops rd max length: int" (optional)
  maximum length of the "iops_rd_max" burst period, in seconds. (Since 2.6)
"iops_wr_max_length: int" (optional)
  maximum length of the "iops_wr_max" burst period, in seconds. (Since 2.6)
"iops_size: int" (optional)
  an I/O size in bytes (Since 1.7)
"group: string" (optional)
  throttle group name (Since 2.4)
"cache: BlockdevCacheInfo"
  the cache mode used for the block device (since: 2.3)
"write threshold: int"
  configured write threshold for the device. 0 if disabled. (Since 2.3)
"dirty-bitmaps: array of BlockDirtyInfo" (optional)
  dirty bitmaps information (only present if node has one or more dirty bitmaps)
  (Since 4.2)
Since: 0.14.0
BlockDeviceIoStatus (Enum)
An enumeration of block device I/O status.
Values:
"ok"
  The last I/O operation has succeeded
"failed"
  The last I/O operation has failed
"nospace"
  The last I/O operation has failed due to a no-space condition
Since: 1.0
BlockDeviceMapEntry (Object)
Entry in the metadata map of the device (returned by "gemu-img map")
Members:
"start: int"
  Offset in the image of the first byte described by this entry (in bytes)
"length: int"
```

Length of the range described by this entry (in bytes)

"depth: int"

Number of layers (0 = top image, 1 = top image's backing file, etc.) before reaching one for which the range is allocated. The value is in the range 0 to the depth of the image chain - 1.

"zero: boolean"

the sectors in this range read as zeros

"data: boolean"

reading the image will actually read data from a file (in particular, if "offset" is present this means that the sectors are not simply preallocated, but contain actual data in raw format)

"offset: int" (optional)

if present, the image file stores the data for this range in raw format at the given offset.

Since: 1.7

DirtyBitmapStatus (Enum)

An enumeration of possible states that a dirty bitmap can report to the user.

Values:

"frozen"

The bitmap is currently in-use by some operation and is immutable. If the bitmap was "active" prior to the operation, new writes by the guest are being recorded in a temporary buffer, and will not be lost. Generally, bitmaps are cleared on successful use in an operation and the temporary buffer is committed into the bitmap. On failure, the temporary buffer is merged back into the bitmap without first clearing it. Please refer to the documentation for each bitmap-using operation, See also "blockdev-backup", "drive-backup".

"disabled"

The bitmap is not currently recording new writes by the guest. This is requested explicitly via "block-dirty-bitmap-disable". It can still be cleared, deleted, or used for backup operations.

"active"

The bitmap is actively monitoring for new writes, and can be cleared, deleted, or used for backup operations.

"locked" Page 35/325

The bitmap is currently in-use by some operation and is immutable. If the bitmap was "active" prior to the operation, it is still recording new writes. If the bitmap was "disabled", it is not recording new writes. (Since 2.12) "inconsistent" This is a persistent dirty bitmap that was marked in-use on disk, and is unusable by QEMU. It can only be deleted. Please rely on the inconsistent field in "BlockDirtyInfo" instead, as the status field is deprecated. (Since 4.0)Since: 2.4 BlockDirtyInfo (Object) Block dirty bitmap information. Members: "name: string" (optional) the name of the dirty bitmap (Since 2.4) "count: int" number of dirty bytes according to the dirty bitmap "granularity: int" granularity of the dirty bitmap in bytes (since 1.4) "status: DirtyBitmapStatus" Deprecated in favor of "recording" and "locked". (since 2.4) "recording: boolean" true if the bitmap is recording new writes from the guest. Replaces `active` and 'disabled' statuses. (since 4.0) "busy: boolean" true if the bitmap is in-use by some operation (NBD or jobs) and cannot be modified via QMP or used by another operation. Replaces `locked` and `frozen` statuses. (since 4.0) "persistent: boolean" true if the bitmap was stored on disk, is scheduled to be stored on disk, or both. (since 4.0) "inconsistent: boolean" (optional) true if this is a persistent bitmap that was improperly stored. Implies

"persistent" to be true; "recording" and "busy" to be false. This bitmap cannot

```
be used. To remove it, use "block-dirty-bitmap-remove". (Since 4.0)
Since: 1.3
Qcow2BitmapInfoFlags (Enum)
An enumeration of flags that a bitmap can report to the user.
```

Values:

"in-use"

This flag is set by any process actively modifying the qcow2 file, and cleared when the updated bitmap is flushed to the qcow2 image. The presence of this flag in an offline image means that the bitmap was not saved correctly after its last usage, and may contain inconsistent data.

"auto"

The bitmap must reflect all changes of the virtual disk by any application that would write to this qcow2 file.

Since: 4.0

Qcow2BitmapInfo (Object)

Qcow2 bitmap information.

Members:

"name: string"

the name of the bitmap

"granularity: int"

granularity of the bitmap in bytes

"flags: array of Qcow2BitmapInfoFlags"

flags of the bitmap

Since: 4.0

BlockLatencyHistogramInfo (Object)

Block latency histogram.

Members:

"boundaries: array of int"

list of interval boundary values in nanoseconds, all greater than zero and in ascending order. For example, the list [10, 50, 100] produces the following histogram intervals: [0, 10), [10, 50), [50, 100), [100, +inf).

"bins: array of int"

len("boundaries") + 1 For the example above, "bins" may be something like [3,

1, 5, 2], and corresponding histogram looks like:

50 100

Since: 4.0

block-latency-histogram-set (Command) Manage read, write and flush latency histograms for the device.

If only "id" parameter is specified, remove all present latency histograms for the device. Otherwise, add/reset some of (or all) latency histograms.

Arguments:

"id: string"

The name or QOM path of the guest device.

"boundaries: array of int" (optional)

list of interval boundary values (see description in BlockLatencyHistogramInfo definition). If specified, all latency histograms are removed, and empty ones created for all io types with intervals corresponding to "boundaries" (except for io types, for which specific boundaries are set through the following parameters).

"boundaries-read: array of int" (optional)

list of interval boundary values for read latency histogram. If specified, old read latency histogram is removed, and empty one created with intervals corresponding to "boundaries-read". The parameter has higher priority then "boundaries".

"boundaries-write: array of int" (optional)

list of interval boundary values for write latency histogram.

"boundaries-flush: array of int" (optional)

list of interval boundary values for flush latency histogram.

Returns: error if device is not found or any boundary arrays are invalid.

Since: 4.0

Example:

set new histograms for all io types with intervals

[0, 10), [10, 50), [50, 100), [100, +inf):

-> { "execute": "block-latency-histogram-set",

```
"arguments": { "id": "drive0",
                  "boundaries": [10, 50, 100] } }
     <- { "return": {} }
Example:
     set new histogram only for write, other histograms will remain
     not changed (or not created):
     -> { "execute": "block-latency-histogram-set",
        "arguments": { "id": "drive0",
                  "boundaries-write": [10, 50, 100] } }
     <- { "return": {} }
Example:
     set new histograms with the following intervals:
      read, flush: [0, 10), [10, 50), [50, 100), [100, +inf)
      write: [0, 1000), [1000, 5000), [5000, +inf)
     -> { "execute": "block-latency-histogram-set",
        "arguments": { "id": "drive0",
                  "boundaries": [10, 50, 100],
                  "boundaries-write": [1000, 5000] } }
     <- { "return": {} }
Example:
     remove all latency histograms:
     -> { "execute": "block-latency-histogram-set",
        "arguments": { "id": "drive0" } }
     <- { "return": {} }
BlockInfo (Object)
Block device information. This structure describes a virtual device and the
backing device associated with it.
Members:
"device: string"
  The device name associated with the virtual device.
"qdev: string" (optional)
  The qdev ID, or if no ID is assigned, the QOM path of the block device. (since
```

2.10) Page 39/325

"type: string"

This field is returned only for compatibility reasons, it should not be used (always returns 'unknown')

"removable: boolean"

True if the device supports removable media.

"locked: boolean"

True if the guest has locked this device from having its media removed

"tray\_open: boolean" (optional)

True if the device's tray is open (only present if it has a tray)

"dirty-bitmaps: array of BlockDirtyInfo" (optional)

dirty bitmaps information (only present if the driver has one or more dirty bitmaps) (Since 2.0) Deprecated in 4.2; see BlockDeviceInfo instead.

"io-status: BlockDeviceIoStatus" (optional)

"BlockDeviceloStatus". Only present if the device supports it and the VM is configured to stop on errors (supported device models: virtio-blk, IDE, SCSI except scsi-generic)

"inserted: BlockDeviceInfo" (optional)

"BlockDeviceInfo" describing the device if media is present

Since: 0.14.0

BlockMeasureInfo (Object)

Image file size calculation information. This structure describes the size requirements for creating a new image file.

The size requirements depend on the new image file format. File size always equals virtual disk size for the 'raw' format, even for sparse POSIX files. Compact formats such as 'qcow2' represent unallocated and zero regions efficiently so file size may be smaller than virtual disk size.

The values are upper bounds that are guaranteed to fit the new image file.

Subsequent modification, such as internal snapshot or bitmap creation, may require additional space and is not covered here.

Members:

"required: int"

Size required for a new image file, in bytes.

"fully-allocated: int" Page 40/325

Image file size, in bytes, once data has been written to all sectors.

```
Since: 2.10
```

query-block (Command) Get a list of BlockInfo for all virtual block devices.

Returns: a list of "BlockInfo" describing each virtual block device. Filter nodes

that were created implicitly are skipped over.

Since: 0.14.0

```
Example:
```

```
-> { "execute": "query-block" }
<- {
    "return":[
     {
        "io-status": "ok",
        "device": "ide0-hd0",
        "locked":false,
        "removable":false,
        "inserted":{
         "ro":false,
         "drv": "qcow2",
          "encrypted":false,
          "file": "disks/test.qcow2",
          "backing_file_depth":1,
          "bps":1000000,
          "bps_rd":0,
          "bps_wr":0,
          "iops":1000000,
          "iops_rd":0,
          "iops_wr":0,
          "bps_max": 8000000,
          "bps_rd_max": 0,
          "bps_wr_max": 0,
          "iops_max": 0,
          "iops_rd_max": 0,
          "iops_wr_max": 0,
```

```

             "type":"unknown"
          },
             "device": "sd0",
             "locked":false,
             "removable":true,
             "type":"unknown"
          }
        ]
      }
BlockDeviceTimedStats (Object)
Statistics of a block device during a given interval of time.
Members:
"interval_length: int"
  Interval used for calculating the statistics, in seconds.
"min_rd_latency_ns: int"
  Minimum latency of read operations in the defined interval, in nanoseconds.
"min_wr_latency_ns: int"
  Minimum latency of write operations in the defined interval, in nanoseconds.
"min_flush_latency_ns: int"
```

Minimum latency of flush operations in the defined interval, in nanoseconds.

"max rd latency ns: int" Maximum latency of read operations in the defined interval, in nanoseconds. "max\_wr\_latency\_ns: int" Maximum latency of write operations in the defined interval, in nanoseconds. "max\_flush\_latency\_ns: int" Maximum latency of flush operations in the defined interval, in nanoseconds. "avg\_rd\_latency\_ns: int" Average latency of read operations in the defined interval, in nanoseconds. "avg wr latency ns: int" Average latency of write operations in the defined interval, in nanoseconds. "avg\_flush\_latency\_ns: int" Average latency of flush operations in the defined interval, in nanoseconds. "avg\_rd\_queue\_depth: number" Average number of pending read operations in the defined interval. "avg\_wr\_queue\_depth: number" Average number of pending write operations in the defined interval. Since: 2.5 BlockDeviceStats (Object) Statistics of a virtual block device or a block backing device. Members: "rd\_bytes: int" The number of bytes read by the device. "wr bytes: int" The number of bytes written by the device. "unmap\_bytes: int" The number of bytes unmapped by the device (Since 4.2) "rd operations: int" The number of read operations performed by the device. "wr\_operations: int" The number of write operations performed by the device. "flush\_operations: int" The number of cache flush operations performed by the device (since 0.15.0)

"unmap\_operations: int"

Page 44/325

The number of unmap operations performed by the device (Since 4.2) "rd total time ns: int" Total time spent on reads in nanoseconds (since 0.15.0). "wr\_total\_time\_ns: int" Total time spent on writes in nanoseconds (since 0.15.0). "flush\_total\_time\_ns: int" Total time spent on cache flushes in nanoseconds (since 0.15.0). "unmap\_total\_time\_ns: int" Total time spent on unmap operations in nanoseconds (Since 4.2) "wr highest offset: int" The offset after the greatest byte written to the device. The intended use of this information is for growable sparse files (like qcow2) that are used on top of a physical device. "rd\_merged: int" Number of read requests that have been merged into another request (Since 2.3). "wr\_merged: int" Number of write requests that have been merged into another request (Since 2.3). "unmap\_merged: int" Number of unmap requests that have been merged into another request (Since 4.2) "idle\_time\_ns: int" (optional) Time since the last I/O operation, in nanoseconds. If the field is absent it means that there haven't been any operations yet (Since 2.5). "failed\_rd\_operations: int" The number of failed read operations performed by the device (Since 2.5) "failed wr operations: int" The number of failed write operations performed by the device (Since 2.5) "failed\_flush\_operations: int" The number of failed flush operations performed by the device (Since 2.5) "failed\_unmap\_operations: int" The number of failed unmap operations performed by the device (Since 4.2) "invalid\_rd\_operations: int"

The number of invalid read operations performed by the device (Since 2.5)

"invalid wr operations: int" The number of invalid write operations performed by the device (Since 2.5) "invalid\_flush\_operations: int" The number of invalid flush operations performed by the device (Since 2.5) "invalid\_unmap\_operations: int" The number of invalid unmap operations performed by the device (Since 4.2) "account\_invalid: boolean" Whether invalid operations are included in the last access statistics (Since 2.5) "account failed: boolean" Whether failed operations are included in the latency and last access statistics (Since 2.5) "timed\_stats: array of BlockDeviceTimedStats" Statistics specific to the set of previously defined intervals of time (Since 2.5) "rd\_latency\_histogram: BlockLatencyHistogramInfo" (optional) "BlockLatencyHistogramInfo". (Since 4.0) "wr latency histogram: BlockLatencyHistogramInfo" (optional) "BlockLatencyHistogramInfo". (Since 4.0) "flush\_latency\_histogram: BlockLatencyHistogramInfo" (optional) "BlockLatencyHistogramInfo". (Since 4.0) Since: 0.14.0 BlockStatsSpecificFile (Object) File driver statistics Members: "discard-nb-ok: int" The number of successful discard operations performed by the driver. "discard-nb-failed: int" The number of failed discard operations performed by the driver. "discard-bytes-ok: int" The number of bytes discarded by the driver. Since: 4.2

Page 46/325

Block driver specific statistics Members: "driver: BlockdevDriver" Not documented The members of "BlockStatsSpecificFile" when "driver" is "file" The members of "BlockStatsSpecificFile" when "driver" is "host\_device" Since: 4.2 BlockStats (Object) Statistics of a virtual block device or a block backing device. Members: "device: string" (optional) If the stats are for a virtual block device, the name corresponding to the virtual block device. "node-name: string" (optional) The node name of the device. (Since 2.3) "qdev: string" (optional) The qdev ID, or if no ID is assigned, the QOM path of the block device. (since 3.0)"stats: BlockDeviceStats" A "BlockDeviceStats" for the device. "driver-specific: BlockStatsSpecific" (optional) Optional driver-specific stats. (Since 4.2) "parent: BlockStats" (optional) This describes the file block device if it has one. Contains recursively the statistics of the underlying protocol (e.g. the host file for a qcow2 image). If there is no underlying protocol, this field is omitted "backing: BlockStats" (optional) This describes the backing block device if it has one. (Since 2.0) Since: 0.14.0 query-blockstats (Command) Query the "BlockStats" for all virtual block devices. Arguments: "query-nodes: boolean" (optional)

If true, the command will query all the block nodes that have a node name, in a

list which will include "parent" information, but not "backing". If false or omitted, the behavior is as before - query all the device backends, recursively including their "parent" and "backing". Filter nodes that were created implicitly are skipped over in this mode. (Since 2.3)

Returns: A list of "BlockStats" for each virtual block devices.

Since: 0.14.0

```
Example:
```

```
-> { "execute": "query-blockstats" }
<- {
    "return":[
     {
       "device": "ide0-hd0",
       "parent":{
         "stats":{

      }
BlockdevOnError (Enum)
An enumeration of possible behaviors for errors on I/O operations. The exact
meaning depends on whether the I/O was initiated by a guest or by a block job
Values:
"report"
  for guest operations, report the error to the guest; for jobs, cancel the job
"ignore"
  ignore the error, only report a QMP event (BLOCK_IO_ERROR or BLOCK_JOB_ERROR)
"enospc"
  same as "stop" on ENOSPC, same as "report" otherwise.
"stop"
  for guest operations, stop the virtual machine; for jobs, pause the job
"auto"
  inherit the error handling policy of the backend (since: 2.7)
Since: 1.3
MirrorSyncMode (Enum)
An enumeration of possible behaviors for the initial synchronization phase of
storage mirroring.
Values:
"top"
  copies data in the topmost image to the destination
"full"
  copies data from all images to the destination
"none"
  only copy data written from now on
```

"incremental"

Page 51/325

```
only copy data described by the dirty bitmap. (since: 2.4)
"bitmap"
  only copy data described by the dirty bitmap. (since: 4.2) Behavior on
  completion is determined by the BitmapSyncMode.
Since: 1.3
BitmapSyncMode (Enum)
An enumeration of possible behaviors for the synchronization of a bitmap when used
for data copy operations.
Values:
"on-success"
  The bitmap is only synced when the operation is successful. This is the
  behavior always used for 'INCREMENTAL' backups.
"never"
  The bitmap is never synchronized with the operation, and is treated solely as a
  read-only manifest of blocks to copy.
"always"
  The bitmap is always synchronized with the operation, regardless of whether or
  not the operation was successful.
Since: 4.2
MirrorCopyMode (Enum)
An enumeration whose values tell the mirror block job when to trigger writes to the
target.
Values:
"background"
  copy data in background only.
"write-blocking"
  when data is written to the source, write it (synchronously) to the target as
  well. In addition, data is copied in background just like in "background"
  mode.
Since: 3.0
BlockJobInfo (Object)
```

Information about a long-running block device operation.

Members: Page 52/325

```
"type: string"
  the job type ('stream' for image streaming)
"device: string"
  The job identifier. Originally the device name but other values are allowed
  since QEMU 2.7
"len: int"
  Estimated "offset" value at the completion of the job. This value can
  arbitrarily change while the job is running, in both directions.
"offset: int"
  Progress made until now. The unit is arbitrary and the value can only
  meaningfully be used for the ratio of "offset" to "len". The value is
  monotonically increasing.
"busy: boolean"
  false if the job is known to be in a quiescent state, with no pending I/O.
  Since 1.3.
"paused: boolean"
  whether the job is paused or, if "busy" is true, will pause itself as soon as
  possible. Since 1.3.
"speed: int"
  the rate limit, bytes per second
"io-status: BlockDeviceIoStatus"
  the status of the job (since 1.3)
"ready: boolean"
  true if the job may be completed (since 2.2)
"status: JobStatus"
  Current job state/status (since 2.12)
"auto-finalize: boolean"
  Job will finalize itself when PENDING, moving to the CONCLUDED state. (since
  2.12)
"auto-dismiss: boolean"
  Job will dismiss itself when CONCLUDED, moving to the NULL state and
  disappearing from the query list. (since 2.12)
"error: string" (optional)
```

Page 53/325

```
Error information if the job did not complete successfully. Not set if the job
  completed successfully. (since 2.12.1)
Since: 1.1
query-block-jobs (Command) Return information about long-running block device
operations.
Returns: a list of "BlockJobInfo" for each active block job
Since: 1.1
block_passwd (Command) This command sets the password of a block device that has
not been open with a password and requires one.
This command is now obsolete and will always return an error since 2.10
Arguments:
"device: string" (optional)
  Not documented
"node-name: string" (optional)
  Not documented
"password: string"
  Not documented
block resize (Command) Resize a block image while a guest is running.
Either "device" or "node-name" must be set but not both.
Arguments:
"device: string" (optional)
  the name of the device to get the image resized
"node-name: string" (optional)
  graph node name to get the image resized (Since 2.0)
"size: int"
  new image size in bytes
Returns: nothing on success If "device" is not a valid block device, DeviceNotFound
Since: 0.14.0
Example:
    -> { "execute": "block_resize",
        "arguments": { "device": "scratch", "size": 1073741824 } }
     <- { "return": {} }
```

An enumeration that tells QEMU how to set the backing file path in a new image file. Values: "existing" QEMU should look for an existing image file. "absolute-paths" QEMU should create a new image with absolute paths for the backing file. If there is no backing file available, the new image will not be backed either. Since: 1.1 BlockdevSnapshotSync (Object) Either "device" or "node-name" must be set but not both. Members: "device: string" (optional) the name of the device to take a snapshot of. "node-name: string" (optional) graph node name to generate the snapshot from (Since 2.0) "snapshot-file: string" the target of the new overlay image. If the file exists, or if it is a device, the overlay will be created in the existing file/device. Otherwise, a new file will be created. "snapshot-node-name: string" (optional) the graph node name of the new image (Since 2.0) "format: string" (optional) the format of the overlay image, default is 'qcow2'. "mode: NewImageMode" (optional) whether and how QEMU should create a new image, default is 'absolute-paths'. BlockdevSnapshot (Object) Members: "node: string" device or node name that will have a snapshot taken. "overlay: string" reference to the existing block device that will become the overlay of "node",

as part of taking the snapshot. It must not have a current backing file (this

```
can be achieved by passing "backing": null to blockdev-add).
Since: 2.5
BackupCommon (Object)
Members:
"job-id: string" (optional)
  identifier for the newly-created block job. If omitted, the device name will be
  used. (Since 2.7)
"device: string"
  the device name or node-name of a root node which should be copied.
"sync: MirrorSyncMode"
  what parts of the disk image should be copied to the destination (all the disk,
  only the sectors allocated in the topmost image, from a dirty bitmap, or only
  new I/O).
"speed: int" (optional)
  the maximum speed, in bytes per second. The default is 0, for unlimited.
"bitmap: string" (optional)
  The name of a dirty bitmap to use. Must be present if sync is "bitmap" or
  "incremental". Can be present if sync is "full" or "top". Must not be present
  otherwise. (Since 2.4 (drive-backup), 3.1 (blockdev-backup))
"bitmap-mode: BitmapSyncMode" (optional)
  Specifies the type of data the bitmap should contain after the operation
  concludes. Must be present if a bitmap was provided, Must NOT be present
  otherwise. (Since 4.2)
"compress: boolean" (optional)
  true to compress data, if the target format supports it. (default: false)
  (since 2.8)
"on-source-error: BlockdevOnError" (optional)
  the action to take on an error on the source, default 'report'. 'stop' and
  'enospc' can only be used if the block device supports io-status (see
  BlockInfo).
"on-target-error: BlockdevOnError" (optional)
  the action to take on an error on the target, default 'report' (no limitations,
```

since this applies to a different block device than "device").

"auto-finalize: boolean" (optional)

When false, this job will wait in a PENDING state after it has finished its

work, waiting for "block-job-finalize" before making any block graph changes.

When true, this job will automatically perform its abort or commit actions.

Defaults to true. (Since 2.12)

"auto-dismiss: boolean" (optional)

When false, this job will wait in a CONCLUDED state after it has completely ceased all work, and awaits "block-job-dismiss". When true, this job will automatically disappear from the query list without user intervention.

Defaults to true. (Since 2.12)

"filter-node-name: string" (optional)

the node name that should be assigned to the filter driver that the backup job inserts into the graph above node specified by "drive". If this option is not given, a node name is autogenerated. (Since: 4.2)

Note: "on-source-error" and "on-target-error" only affect background I/O. If an error occurs during a guest write request, the device's rerror/werror actions will be used.

Since: 4.2

DriveBackup (Object)

Members:

"target: string"

the target of the new image. If the file exists, or if it is a device, the existing file/device will be used as the new destination. If it does not exist, a new file will be created.

"format: string" (optional)

the format of the new destination, default is to probe if "mode" is 'existing', else the format of the source

"mode: NewImageMode" (optional)

whether and how QEMU should create a new image, default is 'absolute-paths'.

The members of "BackupCommon"

Since: 1.6

BlockdevBackup (Object)

Members: Page 57/325

```
"target: string"
```

the device name or node-name of the backup target node.

The members of "BackupCommon"

Since: 2.3

blockdev-snapshot-sync (Command) Takes a synchronous snapshot of a block device.

For the arguments, see the documentation of BlockdevSnapshotSync.

Returns: nothing on success If "device" is not a valid block device, DeviceNotFound

Since: 0.14.0

### Example:

blockdev-snapshot (Command) Takes a snapshot of a block device.

Take a snapshot, by installing 'node' as the backing image of 'overlay'.

Additionally, if 'node' is associated with a block device, the block device changes to using 'overlay' as its new active image.

For the arguments, see the documentation of BlockdevSnapshot.

Since: 2.5

### Example:

change-backing-file (Command) Change the backing file in the image file metadata. This does not cause QEMU to reopen the image file to reparse the backing filename (it may, however, perform a reopen to change permissions from r/o -> r/w -> r/o, if needed). The new backing file string is written into the image file metadata, and the QEMU internal strings are updated.

Arguments:

"image-node-name: string"

The name of the block driver state node of the image to modify. The "device" argument is used to verify "image-node-name" is in the chain described by "device".

"device: string"

The device name or node-name of the root node that owns image-node-name.

"backing-file: string"

The string to write as the backing file. This string is not validated, so care should be taken when specifying the string or the image chain may not be able to be reopened again.

Returns: Nothing on success

If "device" does not exist or cannot be determined, DeviceNotFound

Since: 2.1

block-commit (Command) Live commit of data from overlay image nodes into backing nodes - i.e., writes data between 'top' and 'base' into 'base'.

Arguments:

"job-id: string" (optional)

identifier for the newly-created block job. If omitted, the device name will be used. (Since 2.7)

"device: string"

the device name or node-name of a root node

"base-node: string" (optional)

The node name of the backing image to write data into. If not specified, this is the deepest backing image. (since: 3.1)

"base: string" (optional)

Same as "base-node", except that it is a file name rather than a node name.

This must be the exact filename string that was used to open the node; other

strings, even if addressing the same file, are not accepted (deprecated, use "base-node" instead)

"top-node: string" (optional)

The node name of the backing image within the image chain which contains the topmost data to be committed down. If not specified, this is the active layer.

(since: 3.1)

"top: string" (optional)

Same as "top-node", except that it is a file name rather than a node name. This must be the exact filename string that was used to open the node; other strings, even if addressing the same file, are not accepted (deprecated, use "base-node" instead)

"backing-file: string" (optional)

The backing file string to write into the overlay image of 'top'. If 'top' is the active layer, specifying a backing file string is an error. This filename is not validated.

If a pathname string is such that it cannot be resolved by QEMU, that means that subsequent QMP or HMP commands must use node-names for the image in question, as filename lookup methods will fail.

If not specified, QEMU will automatically determine the backing file string to use, or error out if there is no obvious choice. Care should be taken when specifying the string, to specify a valid filename or protocol. (Since 2.1)

If top == base, that is an error. If top == active, the job will not be completed by itself, user needs to complete the job with the block-job-complete command after getting the ready event. (Since 2.0)

If the base image is smaller than top, then the base image will be resized to be the same size as top. If top is smaller than the base image, the base will not be truncated. If you want the base image size to match the size of the smaller top, you can safely truncate it yourself once the commit operation successfully completes.

"speed: int" (optional)

the maximum speed, in bytes per second

"filter-node-name: string" (optional)

the node name that should be assigned to the filter driver that the commit job

```
inserts into the graph above "top". If this option is not given, a node name is
  autogenerated. (Since: 2.9)
"auto-finalize: boolean" (optional)
  When false, this job will wait in a PENDING state after it has finished its
  work, waiting for "block-job-finalize" before making any block graph changes.
  When true, this job will automatically perform its abort or commit actions.
  Defaults to true. (Since 3.1)
"auto-dismiss: boolean" (optional)
  When false, this job will wait in a CONCLUDED state after it has completely
  ceased all work, and awaits "block-job-dismiss". When true, this job will
  automatically disappear from the query list without user intervention.
  Defaults to true. (Since 3.1)
Returns: Nothing on success If "device" does not exist, DeviceNotFound Any other
error returns a GenericError.
Since: 1.3
Example:
    -> { "execute": "block-commit",
        "arguments": { "device": "virtio0",
                 "top": "/tmp/snap1.gcow2" } }
    <- { "return": {} }
drive-backup (Command) Start a point-in-time copy of a block device to a new
destination. The status of ongoing drive-backup operations can be checked with
query-block-jobs where the BlockJobInfo.type field has the value 'backup'. The
operation can be stopped before it has completed using the block-job-cancel
command.
Arguments: the members of "DriveBackup"
Returns: nothing on success If "device" is not a valid block device, GenericError
Since: 1.6
Example:
    -> { "execute": "drive-backup",
        "arguments": { "device": "drive0",
```

"sync": "full",

"target": "backup.img" } }

```
<- { "return": {} }
```

blockdev-backup (Command) Start a point-in-time copy of a block device to a new destination. The status of ongoing blockdev-backup operations can be checked with query-block-jobs where the BlockJobInfo.type field has the value 'backup'. The operation can be stopped before it has completed using the block-job-cancel command.

Arguments: the members of "BlockdevBackup"

Returns: nothing on success If "device" is not a valid block device, DeviceNotFound

Since: 2.3

### Example:

query-named-block-nodes (Command) Get the named block driver list

Returns: the list of BlockDeviceInfo

Since: 2.0

# Example:

"bps\_max": 8000000,

```
"bps_rd_max": 0,
"bps_wr_max": 0,
"iops_max": 0,
"iops_rd_max": 0,
"iops_wr_max": 0,
"iops_size": 0,
"write_threshold": 0,
"image":{
  "filename": "disks/test.qcow2",
  "format": "qcow2",
  "virtual-size":2048000,
  "backing_file":"base.qcow2",
  "full-backing-filename": "disks/base.qcow2",
  "backing-filename-format": "qcow2",
  "snapshots":[
   {
      "id": "1",
      "name": "snapshot1",
      "vm-state-size": 0,
      "date-sec": 10000200,
      "date-nsec": 12,
      "vm-clock-sec": 206,
      "vm-clock-nsec": 30
   }
 ],
  "backing-image":{
    "filename": "disks/base.qcow2",
    "format": "qcow2",
    "virtual-size":2048000
  }
} } ] }
```

XDbgBlockGraphNodeType (Enum)

Values: Page 63/325

```
"block-backend"
  corresponds to BlockBackend
"block-job"
  corresonds to BlockJob
"block-driver"
  corresponds to BlockDriverState
Since: 4.0
XDbgBlockGraphNode (Object)
Members:
"id: int"
  Block graph node identifier. This "id" is generated only for x-debug-query-
  block-graph and does not relate to any other identifiers in Qemu.
"type: XDbgBlockGraphNodeType"
  Type of graph node. Can be one of block-backend, block-job or block-driver-
  state.
"name: string"
```

Human readable name of the node. Corresponds to node-name for block-driverstate nodes; is not guaranteed to be unique in the whole graph (with block-jobs and block-backends).

Since: 4.0

BlockPermission (Enum)

Enum of base block permissions.

Values:

"consistent-read"

A user that has the "permission" of consistent reads is guaranteed that their view of the contents of the block device is complete and self-consistent, representing the contents of a disk at a specific point. For most block devices (including their backing files) this is true, but the property cannot be maintained in a few situations like for intermediate nodes of a commit block job.

"write"

This permission is required to change the visible disk contents.

"write-unchanged" Page 64/325

This permission (which is weaker than BLK\_PERM\_WRITE) is both enough and required for writes to the block node when the caller promises that the visible disk content doesn't change. As the BLK\_PERM\_WRITE permission is strictly stronger, either is sufficient to perform an unchanging write.

"resize"

This permission is required to change the size of a block node.

"graph-mod"

This permission is required to change the node that this BdrvChild points to.

Since: 4.0

XDbgBlockGraphEdge (Object)

Block Graph edge description for x-debug-query-block-graph.

Members:

"parent: int"

parent id

"child: int"

child id

"name: string"

name of the relation (examples are 'file' and 'backing')

"perm: array of BlockPermission"

granted permissions for the parent operating on the child

"shared-perm: array of BlockPermission"

permissions that can still be granted to other users of the child while it is still attached to this parent

Since: 4.0

XDbgBlockGraph (Object)

Block Graph - list of nodes and list of edges.

Members:

"nodes: array of XDbgBlockGraphNode"

Not documented

"edges: array of XDbgBlockGraphEdge"

Not documented

Since: 4.0

x-debug-query-block-graph (Command) Get the block graph.

```
Since: 4.0
```

drive-mirror (Command) Start mirroring a block device's writes to a new destination. target specifies the target of the new image. If the file exists, or if it is a device, it will be used as the new destination for writes. If it does not exist, a new file will be created. format specifies the format of the mirror image, default is to probe if mode='existing', else the format of the source.

Arguments: the members of "DriveMirror"

Returns: nothing on success If "device" is not a valid block device, GenericError

Since: 1.3

### Example:

DriveMirror (Object)

A set of parameters describing drive mirror setup.

#### Members:

```
"job-id: string" (optional)

identifier for the newly-created block job. If omitted, the device name will be used. (Since 2.7)

"device: string"
```

the device name or node-name of a root node whose writes should be mirrored.

"target: string"

the target of the new image. If the file exists, or if it is a device, the existing file/device will be used as the new destination. If it does not exist, a new file will be created.

"format: string" (optional)

the format of the new destination, default is to probe if "mode" is 'existing', else the format of the source

"node-name: string" (optional)

the new block driver state node name in the graph (Since 2.1)

"replaces: string" (optional) with sync=full graph node name to be replaced by the new image when a whole image copy is done. This can be used to repair broken Quorum files. (Since 2.1) "mode: NewImageMode" (optional) whether and how QEMU should create a new image, default is 'absolute-paths'. "speed: int" (optional) the maximum speed, in bytes per second "sync: MirrorSyncMode" what parts of the disk image should be copied to the destination (all the disk, only the sectors allocated in the topmost image, or only new I/O). "granularity: int" (optional) granularity of the dirty bitmap, default is 64K if the image format doesn't have clusters, 4K if the clusters are smaller than that, else the cluster size. Must be a power of 2 between 512 and 64M (since 1.4). "buf-size: int" (optional) maximum amount of data in flight from source to target (since 1.4). "on-source-error: BlockdevOnError" (optional) the action to take on an error on the source, default 'report'. 'stop' and 'enospc' can only be used if the block device supports io-status (see BlockInfo). "on-target-error: BlockdevOnError" (optional) the action to take on an error on the target, default 'report' (no limitations, since this applies to a different block device than "device"). "unmap: boolean" (optional) Whether to try to unmap target sectors where source has only zero. If true, and target unallocated sectors will read as zero, target image sectors will be unmapped; otherwise, zeroes will be written. Both will result in identical contents. Default is true. (Since 2.4) "copy-mode: MirrorCopyMode" (optional) when to copy data to the destination; defaults to 'background' (Since: 3.0) "auto-finalize: boolean" (optional) When false, this job will wait in a PENDING state after it has finished its

work, waiting for "block-job-finalize" before making any block graph changes.

When true, this job will automatically perform its abort or commit actions. Defaults to true. (Since 3.1) "auto-dismiss: boolean" (optional) When false, this job will wait in a CONCLUDED state after it has completely ceased all work, and awaits "block-job-dismiss". When true, this job will automatically disappear from the query list without user intervention. Defaults to true. (Since 3.1) Since: 1.3 BlockDirtyBitmap (Object) Members: "node: string" name of device/node which the bitmap is tracking "name: string" name of the dirty bitmap Since: 2.4 BlockDirtyBitmapAdd (Object) Members: "node: string" name of device/node which the bitmap is tracking "name: string" name of the dirty bitmap (must be less than 1024 bytes) "granularity: int" (optional) the bitmap granularity, default is 64k for block-dirty-bitmap-add "persistent: boolean" (optional) the bitmap is persistent, i.e. it will be saved to the corresponding block device image file on its close. For now only Qcow2 disks support persistent bitmaps. Default is false for block-dirty-bitmap-add. (Since: 2.10) "disabled: boolean" (optional) the bitmap is created in the disabled state, which means that it will not track drive changes. The bitmap may be enabled with block-dirty-bitmap-enable. Default is false. (Since: 4.0)

Since: 2.4

```
Members:
"local: string"
  name of the bitmap, attached to the same node as target bitmap.
"external: BlockDirtyBitmap"
  bitmap with specified node
Since: 4.1
BlockDirtyBitmapMerge (Object)
Members:
"node: string"
  name of device/node which the "target" bitmap is tracking
"target: string"
  name of the destination dirty bitmap
"bitmaps: array of BlockDirtyBitmapMergeSource"
  name(s) of the source dirty bitmap(s) at "node" and/or fully specifed
  BlockDirtyBitmap elements. The latter are supported since 4.1.
Since: 4.0
block-dirty-bitmap-add (Command) Create a dirty bitmap with a name on the node,
and start tracking the writes.
Returns: nothing on success If "node" is not a valid block device or node,
DeviceNotFound If "name" is already taken, GenericError with an explanation
Since: 2.4
Example:
    -> { "execute": "block-dirty-bitmap-add",
        "arguments": { "node": "drive0", "name": "bitmap0" } }
     <- { "return": {} }
block-dirty-bitmap-remove (Command) Stop write tracking and remove the dirty
bitmap that was created with block-dirty-bitmap-add. If the bitmap is persistent,
remove it from its storage too.
Returns: nothing on success If "node" is not a valid block device or node,
DeviceNotFound If "name" is not found, GenericError with an explanation if "name"
is frozen by an operation, GenericError
```

Since: 2.4

Example: Page 69/325

```
-> { "execute": "block-dirty-bitmap-remove",
        "arguments": { "node": "drive0", "name": "bitmap0" } }
     <- { "return": {} }
block-dirty-bitmap-clear (Command) Clear (reset) a dirty bitmap on the device, so
that an incremental backup from this point in time forward will only backup
clusters modified after this clear operation.
```

Returns: nothing on success If "node" is not a valid block device, DeviceNotFound If "name" is not found, GenericError with an explanation

Since: 2.4

### Example:

```
-> { "execute": "block-dirty-bitmap-clear",
   "arguments": { "node": "drive0", "name": "bitmap0" } }
<- { "return": {} }
```

block-dirty-bitmap-enable (Command) Enables a dirty bitmap so that it will begin tracking disk changes.

Returns: nothing on success If "node" is not a valid block device, DeviceNotFound If "name" is not found, GenericError with an explanation

Since: 4.0

# Example:

```
-> { "execute": "block-dirty-bitmap-enable",
   "arguments": { "node": "drive0", "name": "bitmap0" } }
<- { "return": {} }
```

block-dirty-bitmap-disable (Command) Disables a dirty bitmap so that it will stop tracking disk changes.

Returns: nothing on success If "node" is not a valid block device, DeviceNotFound If "name" is not found, GenericError with an explanation

Since: 4.0

### Example:

```
-> { "execute": "block-dirty-bitmap-disable",
   "arguments": { "node": "drive0", "name": "bitmap0" } }
<- { "return": {} }
```

block-dirty-bitmap-merge (Command) Merge dirty bitmaps listed in "bitmaps" to the "target" dirty bitmap. Dirty bitmaps in "bitmaps" will be unchanged, except if it

also appears as the "target" bitmap. Any bits already set in "target" will still be set after the merge, i.e., this operation does not clear the target. On error, "target" is unchanged.

The resulting bitmap will count as dirty any clusters that were dirty in any of the source bitmaps. This can be used to achieve backup checkpoints, or in simpler usages, to copy bitmaps.

Returns: nothing on success If "node" is not a valid block device, DeviceNotFound

If any bitmap in "bitmaps" or "target" is not found, GenericError If any of the

bitmaps have different sizes or granularities, GenericError

Since: 4.0

Example:

BlockDirtyBitmapSha256 (Object)

SHA256 hash of dirty bitmap data

Members:

"sha256: string"

ASCII representation of SHA256 bitmap hash

Since: 2.10

x-debug-block-dirty-bitmap-sha256 (Command) Get bitmap SHA256.

Returns: BlockDirtyBitmapSha256 on success If "node" is not a valid block device, DeviceNotFound If "name" is not found or if hashing has failed, GenericError with an explanation

Since: 2.10

blockdev-mirror (Command) Start mirroring a block device's writes to a new destination.

Arguments:

"job-id: string" (optional)

identifier for the newly-created block job. If omitted, the device name will be used. (Since 2.7)

"device: string"

The device name or node-name of a root node whose writes should be mirrored. "target: string" the id or node-name of the block device to mirror to. This mustn't be attached to guest. "replaces: string" (optional) with sync=full graph node name to be replaced by the new image when a whole image copy is done. This can be used to repair broken Quorum files. "speed: int" (optional) the maximum speed, in bytes per second "sync: MirrorSyncMode" what parts of the disk image should be copied to the destination (all the disk, only the sectors allocated in the topmost image, or only new I/O). "granularity: int" (optional) granularity of the dirty bitmap, default is 64K if the image format doesn't have clusters, 4K if the clusters are smaller than that, else the cluster size. Must be a power of 2 between 512 and 64M "buf-size: int" (optional) maximum amount of data in flight from source to target "on-source-error: BlockdevOnError" (optional) the action to take on an error on the source, default 'report'. 'stop' and 'enospc' can only be used if the block device supports io-status (see BlockInfo). "on-target-error: BlockdevOnError" (optional) the action to take on an error on the target, default 'report' (no limitations, since this applies to a different block device than "device"). "filter-node-name: string" (optional) the node name that should be assigned to the filter driver that the mirror job inserts into the graph above "device". If this option is not given, a node name is autogenerated. (Since: 2.9) "copy-mode: MirrorCopyMode" (optional) when to copy data to the destination; defaults to 'background' (Since: 3.0)

Page 72/325

"auto-finalize: boolean" (optional)

work, waiting for "block-job-finalize" before making any block graph changes.

When true, this job will automatically perform its abort or commit actions.

Defaults to true. (Since 3.1)

"auto-dismiss: boolean" (optional)

When false, this job will wait in a CONCLUDED state after it has completely ceased all work, and awaits "block-job-dismiss". When true, this job will automatically disappear from the query list without user intervention.

Defaults to true. (Since 3.1)

Returns: nothing on success.

Since: 2.6

Example:

block\_set\_io\_throttle (Command) Change I/O throttle limits for a block drive.

Since QEMU 2.4, each device with I/O limits is member of a throttle group.

If two or more devices are members of the same group, the limits will apply to the combined I/O of the whole group in a round-robin fashion. Therefore, setting new I/O limits to a device will affect the whole group.

The name of the group can be specified using the 'group' parameter. If the parameter is unset, it is assumed to be the current group of that device. If it's not in any group yet, the name of the device will be used as the name for its group.

The 'group' parameter can also be used to move a device to a different group. In this case the limits specified in the parameters will be applied to the new group only.

I/O limits can be disabled by setting all of them to 0. In this case the device will be removed from its group and the rest of its members will not be affected.

The 'group' parameter is ignored.

Arguments: the members of "BlockIOThrottle"

Returns: Nothing on success If "device" is not a valid block device, DeviceNotFound

## Since: 1.1

## Example:

```
-> { "execute": "block_set_io_throttle",
   "arguments": { "id": "virtio-blk-pci0/virtio-backend",
             "bps": 0,
             "bps_rd": 0,
             "bps_wr": 0,
             "iops": 512,
             "iops_rd": 0,
             "iops_wr": 0,
             "bps_max": 0,
             "bps_rd_max": 0,
             "bps_wr_max": 0,
             "iops_max": 0,
             "iops_rd_max": 0,
             "iops_wr_max": 0,
             "bps_max_length": 0,
             "iops_size": 0 } }
<- { "return": {} }
-> { "execute": "block_set_io_throttle",
   "arguments": { "id": "ide0-1-0",
             "bps": 1000000,
             "bps_rd": 0,
             "bps_wr": 0,
             "iops": 0,
             "iops_rd": 0,
             "iops_wr": 0,
             "bps_max": 8000000,
             "bps_rd_max": 0,
             "bps_wr_max": 0,
             "iops_max": 0,
             "iops_rd_max": 0,
             "iops_wr_max": 0,
```

```
"bps max length": 60,
                  "iops_size": 0 } }
     <- { "return": {} }
BlockIOThrottle (Object)
A set of parameters describing block throttling.
Members:
"device: string" (optional)
  Block device name (deprecated, use "id" instead)
"id: string" (optional)
  The name or QOM path of the guest device (since: 2.8)
"bps: int"
  total throughput limit in bytes per second
"bps_rd: int"
  read throughput limit in bytes per second
"bps_wr: int"
  write throughput limit in bytes per second
"iops: int"
  total I/O operations per second
"iops_rd: int"
  read I/O operations per second
"iops_wr: int"
  write I/O operations per second
"bps_max: int" (optional)
  total throughput limit during bursts, in bytes (Since 1.7)
"bps_rd_max: int" (optional)
  read throughput limit during bursts, in bytes (Since 1.7)
"bps_wr_max: int" (optional)
  write throughput limit during bursts, in bytes (Since 1.7)
"iops_max: int" (optional)
  total I/O operations per second during bursts, in bytes (Since 1.7)
"iops_rd_max: int" (optional)
  read I/O operations per second during bursts, in bytes (Since 1.7)
```

"iops\_wr\_max: int" (optional)

```
write I/O operations per second during bursts, in bytes (Since 1.7)
"bps max length: int" (optional)
  maximum length of the "bps_max" burst period, in seconds. It must only be set
  if "bps_max" is set as well. Defaults to 1. (Since 2.6)
"bps_rd_max_length: int" (optional)
  maximum length of the "bps_rd_max" burst period, in seconds. It must only be
  set if "bps_rd_max" is set as well. Defaults to 1. (Since 2.6)
"bps_wr_max_length: int" (optional)
  maximum length of the "bps wr max" burst period, in seconds. It must only be
  set if "bps wr max" is set as well. Defaults to 1. (Since 2.6)
"iops_max_length: int" (optional)
  maximum length of the "iops" burst period, in seconds. It must only be set if
  "iops_max" is set as well. Defaults to 1. (Since 2.6)
"iops_rd_max_length: int" (optional)
  maximum length of the "iops_rd_max" burst period, in seconds. It must only be
  set if "iops_rd_max" is set as well. Defaults to 1. (Since 2.6)
"iops_wr_max_length: int" (optional)
  maximum length of the "iops wr max" burst period, in seconds. It must only be
  set if "iops_wr_max" is set as well. Defaults to 1. (Since 2.6)
"iops_size: int" (optional)
  an I/O size in bytes (Since 1.7)
"group: string" (optional)
  throttle group name (Since 2.4)
Since: 1.1
ThrottleLimits (Object)
Limit parameters for throttling. Since some limit combinations are illegal, limits
should always be set in one transaction. All fields are optional. When setting
limits, if a field is missing the current value is not changed.
Members:
"iops-total: int" (optional)
  limit total I/O operations per second
"iops-total-max: int" (optional)
```

I/O operations burst Page 76/325

```
"iops-total-max-length: int" (optional)
  length of the iops-total-max burst period, in seconds It must only be set if
  "iops-total-max" is set as well.
"iops-read: int" (optional)
  limit read operations per second
"iops-read-max: int" (optional)
  I/O operations read burst
"iops-read-max-length: int" (optional)
  length of the iops-read-max burst period, in seconds It must only be set if
  "iops-read-max" is set as well.
"iops-write: int" (optional)
  limit write operations per second
"iops-write-max: int" (optional)
  I/O operations write burst
"iops-write-max-length: int" (optional)
  length of the iops-write-max burst period, in seconds It must only be set if
  "iops-write-max" is set as well.
"bps-total: int" (optional)
  limit total bytes per second
"bps-total-max: int" (optional)
  total bytes burst
"bps-total-max-length: int" (optional)
  length of the bps-total-max burst period, in seconds. It must only be set if
  "bps-total-max" is set as well.
"bps-read: int" (optional)
  limit read bytes per second
"bps-read-max: int" (optional)
  total bytes read burst
"bps-read-max-length: int" (optional)
  length of the bps-read-max burst period, in seconds It must only be set if
  "bps-read-max" is set as well.
"bps-write: int" (optional)
```

limit write bytes per second

"bps-write-max: int" (optional)

total bytes write burst

"bps-write-max-length: int" (optional)

length of the bps-write-max burst period, in seconds It must only be set if

"bps-write-max" is set as well.

"iops-size: int" (optional)

when limiting by iops max size of an I/O in bytes

Since: 2.11

block-stream (Command) Copy data from a backing file into a block device.

The block streaming operation is performed in the background until the entire backing file has been copied. This command returns immediately once streaming has started. The status of ongoing block streaming operations can be checked with query-block-jobs. The operation can be stopped before it has completed using the block-job-cancel command.

The node that receives the data is called the top image, can be located in any part of the chain (but always above the base image; see below) and can be specified using its device or node name. Earlier gemu versions only allowed 'device' to name the top level node; presence of the 'base-node' parameter during introspection can be used as a witness of the enhanced semantics of 'device'.

If a base file is specified then sectors are not copied from that base file and its backing chain. When streaming completes the image file will have the base file as its backing file. This can be used to stream a subset of the backing file chain instead of flattening the entire image.

On successful completion the image file is updated to drop the backing file and the BLOCK\_JOB\_COMPLETED event is emitted.

Arguments:

"job-id: string" (optional)

identifier for the newly-created block job. If omitted, the device name will be

used. (Since 2.7)

"device: string"

the device or node name of the top image

"base: string" (optional)

the common backing file name. It cannot be set if "base-node" is also set.

```
"base-node: string" (optional)
  the node name of the backing file. It cannot be set if "base" is also set.
  (Since 2.8)
"backing-file: string" (optional)
  The backing file string to write into the top image. This filename is not
  validated.
  If a pathname string is such that it cannot be resolved by QEMU, that means
  that subsequent QMP or HMP commands must use node-names for the image in
  question, as filename lookup methods will fail.
  If not specified, QEMU will automatically determine the backing file string to
  use, or error out if there is no obvious choice. Care should be taken when
  specifying the string, to specify a valid filename or protocol. (Since 2.1)
"speed: int" (optional)
  the maximum speed, in bytes per second
"on-error: BlockdevOnError" (optional)
  the action to take on an error (default report). 'stop' and 'enospc' can only
  be used if the block device supports io-status (see BlockInfo). Since 1.3.
"auto-finalize: boolean" (optional)
  When false, this job will wait in a PENDING state after it has finished its
  work, waiting for "block-job-finalize" before making any block graph changes.
  When true, this job will automatically perform its abort or commit actions.
  Defaults to true. (Since 3.1)
"auto-dismiss: boolean" (optional)
  When false, this job will wait in a CONCLUDED state after it has completely
  ceased all work, and awaits "block-job-dismiss". When true, this job will
  automatically disappear from the query list without user intervention.
  Defaults to true. (Since 3.1)
Returns: Nothing on success. If "device" does not exist, DeviceNotFound.
Since: 1.1
Example:
     -> { "execute": "block-stream",
        "arguments": { "device": "virtio0",
                  "base": "/tmp/master.qcow2" } }
```

<- { "return": {} }

block-job-set-speed (Command) Set maximum speed for a background block operation.

This command can only be issued when there is an active block job.

Throttling can be disabled by setting the speed to 0.

Arguments:

"device: string"

The job identifier. This used to be a device name (hence the name of the parameter), but since QEMU 2.7 it can have other values.

"speed: int"

the maximum speed, in bytes per second, or 0 for unlimited. Defaults to 0.

Returns: Nothing on success If no background operation is active on this device,

DeviceNotActive

Since: 1.1

block-job-cancel (Command) Stop an active background block operation.

This command returns immediately after marking the active background block operation for cancellation. It is an error to call this command if no operation is in progress.

The operation will cancel as soon as possible and then emit the BLOCK\_JOB\_CANCELLED event. Before that happens the job is still visible when enumerated using query-block-jobs.

Note that if you issue 'block-job-cancel' after 'drive-mirror' has indicated (via the event BLOCK\_JOB\_READY) that the source and destination are synchronized, then the event triggered by this command changes to BLOCK\_JOB\_COMPLETED, to indicate that the mirroring has ended and the destination now has a point-in-time copy tied to the time of the cancellation.

For streaming, the image file retains its backing file unless the streaming operation happens to complete just as it is being cancelled. A new streaming operation can be started at a later time to finish copying all data from the backing file.

Arguments:

"device: string"

The job identifier. This used to be a device name (hence the name of the parameter), but since QEMU 2.7 it can have other values.

"force: boolean" (optional)

If true, and the job has already emitted the event BLOCK\_JOB\_READY, abandon the job immediately (even if it is paused) instead of waiting for the destination to complete its final synchronization (since 1.3)

Returns: Nothing on success If no background operation is active on this device,

**DeviceNotActive** 

Since: 1.1

block-job-pause (Command) Pause an active background block operation.

This command returns immediately after marking the active background block operation for pausing. It is an error to call this command if no operation is in progress or if the job is already paused.

The operation will pause as soon as possible. No event is emitted when the operation is actually paused. Cancelling a paused job automatically resumes it.

Arguments:

"device: string"

The job identifier. This used to be a device name (hence the name of the parameter), but since QEMU 2.7 it can have other values.

Returns: Nothing on success If no background operation is active on this device,

DeviceNotActive

Since: 1.3

block-job-resume (Command) Resume an active background block operation.

This command returns immediately after resuming a paused background block operation. It is an error to call this command if no operation is in progress or if the job is not paused.

This command also clears the error status of the job.

Arguments:

"device: string"

The job identifier. This used to be a device name (hence the name of the parameter), but since QEMU 2.7 it can have other values.

Returns: Nothing on success If no background operation is active on this device,

**DeviceNotActive** 

Since: 1.3

block operation. This is supported for drive mirroring, where it also switches the device to write to the target path only. The ability to complete is signaled with a BLOCK\_JOB\_READY event.

This command completes an active background block operation synchronously. The ordering of this command's return with the BLOCK\_JOB\_COMPLETED event is not defined. Note that if an I/O error occurs during the processing of this command:

1) the command itself will fail; 2) the error will be processed according to the rerror/werror arguments that were specified when starting the operation.

A cancelled or paused job cannot be completed.

Arguments:

"device: string"

The job identifier. This used to be a device name (hence the name of the parameter), but since QEMU 2.7 it can have other values.

Returns: Nothing on success If no background operation is active on this device,

**DeviceNotActive** 

Since: 1.3

block-job-dismiss (Command) For jobs that have already concluded, remove them from the block-job-query list. This command only needs to be run for jobs which were started with QEMU 2.12+ job lifetime management semantics.

This command will refuse to operate on any job that has not yet reached its terminal state, JOB\_STATUS\_CONCLUDED. For jobs that make use of the BLOCK\_JOB\_READY event, block-job-cancel or block-job-complete will still need to be used as appropriate.

Arguments:

"id: string"

The job identifier.

Returns: Nothing on success

Since: 2.12

block-job-finalize (Command) Once a job that has manual=true reaches the pending state, it can be instructed to finalize any graph changes and do any necessary cleanup via this command. For jobs in a transaction, instructing one job to finalize will force ALL jobs in the transaction to finalize, so it is only necessary to instruct a single member job to finalize.

```
Arguments:
"id: string"
  The job identifier.
Returns: Nothing on success
Since: 2.12
BlockdevDiscardOptions (Enum)
Determines how to handle discard requests.
Values:
"ignore"
  Ignore the request
"unmap"
  Forward as an unmap request
Since: 2.9
BlockdevDetectZeroesOptions (Enum)
Describes the operation mode for the automatic conversion of plain zero writes by
the OS to driver specific optimized zero write commands.
Values:
"off"
  Disabled (default)
"on"
  Enabled
"unmap"
  Enabled and even try to unmap blocks if possible. This requires also that
  "BlockdevDiscardOptions" is set to unmap for this device.
Since: 2.1
BlockdevAioOptions (Enum)
Selects the AIO backend to handle I/O requests
Values:
"threads"
  Use gemu's thread pool
"native"
  Use native AIO backend (only Linux and Windows)
```

Since: 2.9 Page 83/325

```
BlockdevCacheOptions (Object)
Includes cache-related options for block devices
Members:
"direct: boolean" (optional)
  enables use of O_DIRECT (bypass the host page cache; default: false)
"no-flush: boolean" (optional)
  ignore any flush requests for the device (default: false)
Since: 2.9
BlockdevDriver (Enum)
Drivers that are supported in block device operations.
Values:
"vxhs"
  Since 2.10
"throttle"
  Since 2.11
"nvme"
  Since 2.12
"copy-on-read"
  Since 3.0
"blklogwrites"
  Since 3.0
"blkreplay"
  Since 4.2
"blkdebug"
  Not documented
"blkverify"
  Not documented

Members: "filename: string" path to the image file "pr-manager: string" (optional)

the id for the object that will handle persistent reservations for this device

(default: none, forward the commands via SG IO; since 2.11) "aio: BlockdevAioOptions" (optional) AIO backend (default: threads) (since: 2.8) "locking: OnOffAuto" (optional) whether to enable file locking. If set to 'auto', only enable when Open File Descriptor (OFD) locking API is available (default: auto, since 2.10) "drop-cache: boolean" (optional) invalidate page cache during live migration. This prevents stale data on the migration destination with cache.direct=off. Currently only supported on Linux hosts. (default: on, since: 4.0) If: "defined(CONFIG\_LINUX)" "x-check-cache-dropped: boolean" (optional) whether to check that page cache was dropped on live migration. May cause noticeable delays if the image file is large, do not use in production. (default: off) (since: 3.0) Features: "dynamic-auto-read-only" If present, enabled auto-read-only means that the driver will open the image read-only at first, dynamically reopen the image file read-write when the first writer is attached to the node and reopen read-only when the last writer is detached. This allows giving QEMU write permissions only on demand when an operation actually needs write access. Since: 2.9 BlockdevOptionsNull (Object) Driver specific block device options for the null backend. Members: "size: int" (optional) size of the device in bytes. "latency-ns: int" (optional) emulated latency (in nanoseconds) in processing requests. Default to zero which completes requests immediately. (Since 2.4) "read-zeroes: boolean" (optional) if true, reads from the device produce zeroes; if false, the buffer is left

unchanged. (default: false; since: 4.1)

```
Since: 2.9
BlockdevOptionsNVMe (Object)
Driver specific block device options for the NVMe backend.
Members:
"device: string"
  PCI controller address of the NVMe device in format hhhh:bb:ss.f
  (host:bus:slot.function)
"namespace: int"
  namespace number of the device, starting from 1.
Note that the PCI "device" must have been unbound from any host kernel driver
before instructing QEMU to add the blockdev.
Since: 2.12
BlockdevOptionsVVFAT (Object)
Driver specific block device options for the vvfat protocol.
Members:
"dir: string"
  directory to be exported as FAT image
"fat-type: int" (optional)
  FAT type: 12, 16 or 32
"floppy: boolean" (optional)
  whether to export a floppy image (true) or partitioned hard disk (false;
  default)
"label: string" (optional)
  set the volume label, limited to 11 bytes. FAT16 and FAT32 traditionally have
  some restrictions on labels, which are ignored by most operating systems.
  Defaults to "QEMU VVFAT". (since 2.4)
"rw: boolean" (optional)
  whether to allow write operations (default: false)
Since: 2.9
BlockdevOptionsGenericFormat (Object)
Driver specific block device options for image format that have no option besides
```

their data source.

Members: Page 88/325

"file: BlockdevRef" reference to or definition of the data source block device Since: 2.9 BlockdevOptionsLUKS (Object) Driver specific block device options for LUKS. Members: "key-secret: string" (optional) the ID of a QCryptoSecret object providing the decryption key (since 2.6). Mandatory except when doing a metadata-only probe of the image. The members of "BlockdevOptionsGenericFormat" Since: 2.9 BlockdevOptionsGenericCOWFormat (Object) Driver specific block device options for image format that have no option besides their data source and an optional backing file. Members: "backing: BlockdevRefOrNull" (optional) reference to or definition of the backing file block device, null disables the backing file entirely. Defaults to the backing file stored the image file. The members of "BlockdevOptionsGenericFormat" Since: 2.9 Qcow2OverlapCheckMode (Enum) General overlap check modes. Values: "none" Do not perform any checks "constant" Perform only checks which can be done in constant time and without reading anything from disk

"cached"

Perform only checks which can be done without reading anything from disk

"all"

Perform all available overlap checks

Since: 2.9 Page 89/325

Qcow2OverlapCheckFlags (Object)

Structure of flags for each metadata structure. Setting a field to 'true' makes qemu guard that structure against unintended overwriting. The default value is chosen according to the template given.

Members:

"template: Qcow2OverlapCheckMode" (optional)

Specifies a template mode which can be adjusted using the other flags, defaults

to 'cached'

"bitmap-directory: boolean" (optional)

since 3.0

"main-header: boolean" (optional)

Not documented

"active-I1: boolean" (optional)

Not documented

"active-I2: boolean" (optional)

Not documented

"refcount-table: boolean" (optional)

Not documented

"refcount-block: boolean" (optional)

Not documented

"snapshot-table: boolean" (optional)

Not documented

"inactive-I1: boolean" (optional)

Not documented

"inactive-I2: boolean" (optional)

Not documented

Since: 2.9

Qcow2OverlapChecks (Alternate)

Specifies which metadata structures should be guarded against unintended

overwriting.

Members:

"flags: Qcow2OverlapCheckFlags"

set of flags for separate specification of each metadata structure type

"mode: Qcow2OverlapCheckMode" named mode which chooses a specific set of flags Since: 2.9 BlockdevQcowEncryptionFormat (Enum) Values: "aes" AES-CBC with plain64 initialization vectors Since: 2.10 BlockdevQcowEncryption (Object) Members: "format: BlockdevQcowEncryptionFormat" Not documented The members of "QCryptoBlockOptionsQCow" when "format" is "aes" Since: 2.10 BlockdevOptionsQcow (Object) Driver specific block device options for qcow. Members: "encrypt: BlockdevQcowEncryption" (optional) Image decryption options. Mandatory for encrypted images, except when doing a metadata-only probe of the image. The members of "BlockdevOptionsGenericCOWFormat" Since: 2.10 BlockdevQcow2EncryptionFormat (Enum) Values: "aes" AES-CBC with plain64 initialization vectors "luks" Not documented Since: 2.10 BlockdevQcow2Encryption (Object) Members: "format: BlockdevQcow2EncryptionFormat"

Not documented Page 91/325

The members of "QCryptoBlockOptionsQCow" when "format" is "aes" The members of "QCryptoBlockOptionsLUKS" when "format" is "luks" Since: 2.10 BlockdevOptionsQcow2 (Object) Driver specific block device options for qcow2. Members: "lazy-refcounts: boolean" (optional) whether to enable the lazy refcounts feature (default is taken from the image file) "pass-discard-request: boolean" (optional) whether discard requests to the gcow2 device should be forwarded to the data source "pass-discard-snapshot: boolean" (optional) whether discard requests for the data source should be issued when a snapshot operation (e.g. deleting a snapshot) frees clusters in the qcow2 file "pass-discard-other: boolean" (optional) whether discard requests for the data source should be issued on other occasions where a cluster gets freed "overlap-check: Qcow2OverlapChecks" (optional) which overlap checks to perform for writes to the image, defaults to 'cached' (since 2.2) "cache-size: int" (optional) the maximum total size of the L2 table and refcount block caches in bytes (since 2.2) "I2-cache-size: int" (optional) the maximum size of the L2 table cache in bytes (since 2.2) "I2-cache-entry-size: int" (optional) the size of each entry in the L2 cache in bytes. It must be a power of two between 512 and the cluster size. The default value is the cluster size (since 2.12) "refcount-cache-size: int" (optional) the maximum size of the refcount block cache in bytes (since 2.2) "cache-clean-interval: int" (optional)

```
clean unused entries in the L2 and refcount caches. The interval is in seconds.
  The default value is 600 on supporting platforms, and 0 on other platforms. 0
  disables this feature. (since 2.5)
"encrypt: BlockdevQcow2Encryption" (optional)
  Image decryption options. Mandatory for encrypted images, except when doing a
  metadata-only probe of the image. (since 2.10)
"data-file: BlockdevRef" (optional)
  reference to or definition of the external data file. This may only be
  specified for images that require an external data file. If it is not specified
  for such an image, the data file name is loaded from the image file. (since
  4.0)
The members of "BlockdevOptionsGenericCOWFormat"
Since: 2.9
SshHostKeyCheckMode (Enum)
"none"
              Don't check the host key at all "hash"
                                                          Compare the
host key with a given hash "known_hosts"
                                            Check the host key against the
known_hosts file
Values:
"none"
  Not documented
"hash"
  Not documented
"known hosts"
  Not documented
Since: 2.12
SshHostKeyCheckHashType (Enum)
"md5"
              The given hash is an md5 hash "sha1"
                                                            The given hash
is an sha1 hash
Values:
"md5"
  Not documented
"sha1"
```

Not documented Page 93/325

```
Since: 2.12
SshHostKeyHash (Object)
"type"
             The hash algorithm used for the hash "hash"
                                                                The
expected hash value
Members:
"type: SshHostKeyCheckHashType"
  Not documented
"hash: string"
  Not documented
Since: 2.12
SshHostKeyCheck (Object)
Members:
"mode: SshHostKeyCheckMode"
  Not documented
The members of "SshHostKeyHash" when "mode" is "hash"
Since: 2.12
BlockdevOptionsSsh (Object)
Members:
"server: InetSocketAddress"
  host address
"path: string"
  path to the image on the host
"user: string" (optional)
  user as which to connect, defaults to current local user name
"host-key-check: SshHostKeyCheck" (optional)
  Defines how and what to check the host key against (default: known_hosts)
Since: 2.9
BlkdebugEvent (Enum)
Trigger events supported by blkdebug.
Values:
"I1_shrink_write_table"
  write zeros to the I1 table to shrink image. (since 2.11)
```

"I1\_shrink\_free\_I2\_clusters"

```
discard the I2 tables. (since 2.11)
"cor_write"
  a write due to copy-on-read (since 2.11)
"cluster_alloc_space"
  an allocation of file space for a cluster (since 4.1)
"none"
  triggers once at creation of the blkdebug node (since 4.1)
"I1_update"

Since: 4.1
BlkdebugInjectErrorOptions (Object)
Describes a single error injection for blkdebug.
Members:
"event: BlkdebugEvent"
  trigger event
"state: int" (optional)
  the state identifier blkdebug needs to be in to actually trigger the event;
  defaults to "any"
"iotype: BlkdebugIOType" (optional)
  the type of I/O operations on which this error should be injected; defaults to
  "all read, write, write-zeroes, discard, and flush operations" (since: 4.1)
"errno: int" (optional)
  error identifier (errno) to be returned; defaults to EIO
"sector: int" (optional)
  specifies the sector index which has to be affected in order to actually
  trigger the event; defaults to "any sector"
"once: boolean" (optional)
  disables further events after this one has been triggered; defaults to false
"immediately: boolean" (optional)
  fail immediately; defaults to false
Since: 2.9
```

Describes a single state-change event for blkdebug. Members: "event: BlkdebugEvent" trigger event "state: int" (optional) the current state identifier blkdebug needs to be in; defaults to "any" "new\_state: int" the state identifier blkdebug is supposed to assume if this event is triggered Since: 2.9 BlockdevOptionsBlkdebug (Object) Driver specific block device options for blkdebug. Members: "image: BlockdevRef" underlying raw block device (or image file) "config: string" (optional) filename of the configuration file "align: int" (optional) required alignment for requests in bytes, must be positive power of 2, or 0 for default "max-transfer: int" (optional) maximum size for I/O transfers in bytes, must be positive multiple of "align" and of the underlying file's request alignment (but need not be a power of 2), or 0 for default (since 2.10) "opt-write-zero: int" (optional) preferred alignment for write zero requests in bytes, must be positive multiple of "align" and of the underlying file's request alignment (but need not be a power of 2), or 0 for default (since 2.10) "max-write-zero: int" (optional) maximum size for write zero requests in bytes, must be positive multiple of "align", of "opt-write-zero", and of the underlying file's request alignment (but need not be a power of 2), or 0 for default (since 2.10) "opt-discard: int" (optional)

preferred alignment for discard requests in bytes, must be positive multiple of

```
"align" and of the underlying file's request alignment (but need not be a power
  of 2), or 0 for default (since 2.10)
"max-discard: int" (optional)
  maximum size for discard requests in bytes, must be positive multiple of
  "align", of "opt-discard", and of the underlying file's request alignment (but
  need not be a power of 2), or 0 for default (since 2.10)
"inject-error: array of BlkdebugInjectErrorOptions" (optional)
  array of error injection descriptions
"set-state: array of BlkdebugSetStateOptions" (optional)
  array of state-change descriptions
"take-child-perms: array of BlockPermission" (optional)
  Permissions to take on "image" in addition to what is necessary anyway (which
  depends on how the blkdebug node is used). Defaults to none. (since 5.0)
"unshare-child-perms: array of BlockPermission" (optional)
  Permissions not to share on "image" in addition to what cannot be shared anyway
  (which depends on how the blkdebug node is used). Defaults to none. (since
  5.0)
Since: 2.9
BlockdevOptionsBlklogwrites (Object)
Driver specific block device options for blklogwrites.
Members:
"file: BlockdevRef"
  block device
"log: BlockdevRef"
  block device used to log writes to "file"
"log-sector-size: int" (optional)
  sector size used in logging writes to "file", determines granularity of offsets
  and sizes of writes (default: 512)
"log-append: boolean" (optional)
  append to an existing log (default: false)
"log-super-update-interval: int" (optional)
  interval of write requests after which the log super block is updated to disk
```

(default: 4096) Page 100/325

Since: 3.0 BlockdevOptionsBlkverify (Object) Driver specific block device options for blkverify. Members: "test: BlockdevRef" block device to be tested "raw: BlockdevRef" raw image used for verification Since: 2.9 BlockdevOptionsBlkreplay (Object) Driver specific block device options for blkreplay. Members: "image: BlockdevRef" disk image which should be controlled with blkreplay Since: 4.2 QuorumReadPattern (Enum) An enumeration of quorum read patterns. Values: "quorum" read all the children and do a quorum vote on reads "fifo" read only from the first child that has not failed Since: 2.9 BlockdevOptionsQuorum (Object) Driver specific block device options for Quorum Members: "blkverify: boolean" (optional) true if the driver must print content mismatch set to false by default "children: array of BlockdevRef" the children block devices to use "vote-threshold: int" the vote limit under which a read will fail

"rewrite-corrupted: boolean" (optional)

```
rewrite corrupted data when quorum is reached (Since 2.1)
"read-pattern: QuorumReadPattern" (optional)
  choose read pattern and set to quorum by default (Since 2.2)
Since: 2.9
BlockdevOptionsGluster (Object)
Driver specific block device options for Gluster
Members:
"volume: string"
  name of gluster volume where VM image resides
"path: string"
  absolute path to image file in gluster volume
"server: array of SocketAddress"
  gluster servers description
"debug: int" (optional)
  libgfapi log level (default '4' which is Error) (Since 2.8)
"logfile: string" (optional)
  libgfapi log file (default /dev/stderr) (Since 2.8)
Since: 2.9
IscsiTransport (Enum)
An enumeration of libiscsi transport types
Values:
"tcp"
  Not documented
"iser"
  Not documented
Since: 2.9
IscsiHeaderDigest (Enum)
An enumeration of header digests supported by libiscsi
Values:
"crc32c"
  Not documented
"none"
```

Not documented Page 102/325

```
"crc32c-none"
  Not documented
"none-crc32c"
  Not documented
Since: 2.9
BlockdevOptionsIscsi (Object)
Members:
"transport: IscsiTransport"
  The iscsi transport type
"portal: string"
  The address of the iscsi portal
"target: string"
  The target iqn name
"lun: int" (optional)
  LUN to connect to. Defaults to 0.
"user: string" (optional)
  User name to log in with. If omitted, no CHAP authentication is performed.
"password-secret: string" (optional)
  The ID of a QCryptoSecret object providing the password for the login. This
  option is required if "user" is specified.
"initiator-name: string" (optional)
  The iqn name we want to identify to the target as. If this option is not
  specified, an initiator name is generated automatically.
"header-digest: IscsiHeaderDigest" (optional)
  The desired header digest. Defaults to none-crc32c.
"timeout: int" (optional)
  Timeout in seconds after which a request will timeout. 0 means no timeout and
  is the default.
Driver specific block device options for iscsi
Since: 2.9
RbdAuthMode (Enum)
Values:
```

"cephx"

Not documented "none" Not documented Since: 3.0 BlockdevOptionsRbd (Object) Members: "pool: string" Ceph pool name. "image: string" Image name in the Ceph pool. "conf: string" (optional) path to Ceph configuration file. Values in the configuration file will be overridden by options specified via QAPI. "snapshot: string" (optional) Ceph snapshot name. "user: string" (optional) Ceph id name. "auth-client-required: array of RbdAuthMode" (optional) Acceptable authentication modes. This maps to Ceph configuration option "auth\_client\_required". (Since 3.0) "key-secret: string" (optional) ID of a QCryptoSecret object providing a key for cephx authentication. This maps to Ceph configuration option "key". (Since 3.0) "server: array of InetSocketAddressBase" (optional) Monitor host address and port. This maps to the "mon\_host" Ceph option. Since: 2.9 BlockdevOptionsSheepdog (Object) Driver specific block device options for sheepdog Members: "vdi: string" Virtual disk image name "server: SocketAddress"

```
"snap-id: int" (optional)
  Snapshot ID
"tag: string" (optional)
  Snapshot tag name
Only one of "snap-id" and "tag" may be present.
Since: 2.9
ReplicationMode (Enum)
An enumeration of replication modes.
Values:
"primary"
  Primary mode, the vm's state will be sent to secondary QEMU.
"secondary"
  Secondary mode, receive the vm's state from primary QEMU.
Since: 2.9
If: "defined(CONFIG_REPLICATION)"
BlockdevOptionsReplication (Object)
Driver specific block device options for replication
Members:
"mode: ReplicationMode"
  the replication mode
"top-id: string" (optional)
  In secondary mode, node name or device ID of the root node who owns the
  replication node chain. Must not be given in primary mode.
The members of "BlockdevOptionsGenericFormat"
Since: 2.9
If: "defined(CONFIG_REPLICATION)"
NFSTransport (Enum)
An enumeration of NFS transport types
Values:
"inet"
  TCP transport
Since: 2.9
```

NFSServer (Object) Page 105/325

```
Captures the address of the socket
Members:
"type: NFSTransport"
  transport type used for NFS (only TCP supported)
"host: string"
  host address for NFS server
Since: 2.9
BlockdevOptionsNfs (Object)
Driver specific block device option for NFS
Members:
"server: NFSServer"
  host address
"path: string"
  path of the image on the host
"user: int" (optional)
  UID value to use when talking to the server (defaults to 65534 on Windows and
  getuid() on unix)
"group: int" (optional)
  GID value to use when talking to the server (defaults to 65534 on Windows and
  getgid() in unix)
"tcp-syn-count: int" (optional)
  number of SYNs during the session establishment (defaults to libnfs default)
"readahead-size: int" (optional)
  set the readahead size in bytes (defaults to libnfs default)
"page-cache-size: int" (optional)
  set the pagecache size in bytes (defaults to libnfs default)
"debug: int" (optional)
  set the NFS debug level (max 2) (defaults to libnfs default)
Since: 2.9
BlockdevOptionsCurlBase (Object)
Driver specific block device options shared by all protocols supported by the curl
backend.
```

Members:

Page 106/325

```
"url: string"
  URL of the image file
"readahead: int" (optional)
  Size of the read-ahead cache; must be a multiple of 512 (defaults to 256 kB)
"timeout: int" (optional)
  Timeout for connections, in seconds (defaults to 5)
"username: string" (optional)
  Username for authentication (defaults to none)
"password-secret: string" (optional)
  ID of a QCryptoSecret object providing a password for authentication (defaults
  to no password)
"proxy-username: string" (optional)
  Username for proxy authentication (defaults to none)
"proxy-password-secret: string" (optional)
  ID of a QCryptoSecret object providing a password for proxy authentication
  (defaults to no password)
Since: 2.9
BlockdevOptionsCurlHttp (Object)
Driver specific block device options for HTTP connections over the curl backend.
URLs must start with "http://".
Members:
"cookie: string" (optional)
  List of cookies to set; format is "name1=content1; name2=content2;" as
  explained by CURLOPT_COOKIE(3). Defaults to no cookies.
"cookie-secret: string" (optional)
  ID of a QCryptoSecret object providing the cookie data in a secure way. See
  "cookie" for the format. (since 2.10)
The members of "BlockdevOptionsCurlBase"
Since: 2.9
BlockdevOptionsCurlHttps (Object)
Driver specific block device options for HTTPS connections over the curl backend.
URLs must start with "https://".
```

Members: Page 107/325

```
"cookie: string" (optional)
  List of cookies to set; format is "name1=content1; name2=content2;" as
  explained by CURLOPT_COOKIE(3). Defaults to no cookies.
"sslverify: boolean" (optional)
  Whether to verify the SSL certificate's validity (defaults to true)
"cookie-secret: string" (optional)
  ID of a QCryptoSecret object providing the cookie data in a secure way. See
  "cookie" for the format. (since 2.10)
The members of "BlockdevOptionsCurlBase"
Since: 2.9
BlockdevOptionsCurlFtp (Object)
Driver specific block device options for FTP connections over the curl backend.
URLs must start with "ftp://".
Members:
The members of "BlockdevOptionsCurlBase"
Since: 2.9
BlockdevOptionsCurlFtps (Object)
Driver specific block device options for FTPS connections over the curl backend.
URLs must start with "ftps://".
Members:
"sslverify: boolean" (optional)
  Whether to verify the SSL certificate's validity (defaults to true)
The members of "BlockdevOptionsCurlBase"
Since: 2.9
BlockdevOptionsNbd (Object)
Driver specific block device options for NBD.
Members:
"server: SocketAddress"
  NBD server address
"export: string" (optional)
  export name
"tls-creds: string" (optional)
```

TLS credentials ID Page 108/325

"x-dirty-bitmap: string" (optional) A "gemu:dirty-bitmap:NAME" string to guery in place of traditional "base:allocation" block status (see NBD\_OPT\_LIST\_META\_CONTEXT in the NBD protocol) (since 3.0) "reconnect-delay: int" (optional) On an unexpected disconnect, the nbd client tries to connect again until succeeding or encountering a serious error. During the first "reconnect-delay" seconds, all requests are paused and will be rerun on a successful reconnect. After that time, any delayed requests and all future requests before a successful reconnect will immediately fail. Default 0 (Since 4.2) Since: 2.9 BlockdevOptionsRaw (Object) Driver specific block device options for the raw driver. Members: "offset: int" (optional) position where the block device starts "size: int" (optional) the assumed size of the device The members of "BlockdevOptionsGenericFormat" Since: 2.9 BlockdevOptionsVxHS (Object) Driver specific block device options for VxHS Members: "vdisk-id: string" UUID of VxHS volume "server: InetSocketAddressBase" vxhs server IP, port "tls-creds: string" (optional) TLS credentials ID Since: 2.10 BlockdevOptionsThrottle (Object)

Members: Page 109/325

Driver specific block device options for the throttle driver

"throttle-group: string"

the name of the throttle-group object to use. It must already exist.

"file: BlockdevRef"

reference to or definition of the data source block device

Since: 2.11

BlockdevOptions (Object)

Options for creating a block device. Many options are available for all block devices, independent of the block driver:

Members:

"driver: BlockdevDriver"

block driver name

"node-name: string" (optional)

the node name of the new node (Since 2.0). This option is required on the top level of blockdev-add. Valid node names start with an alphabetic character and may contain only alphanumeric characters, '-', '.' and '\_'. Their maximum length is 31 characters.

"discard: BlockdevDiscardOptions" (optional)

discard-related options (default: ignore)

"cache: BlockdevCacheOptions" (optional)

cache-related options

"read-only: boolean" (optional)

whether the block device should be read-only (default: false). Note that some block drivers support only read-only access, either generally or in certain configurations. In this case, the default value does not work and the option must be specified explicitly.

"auto-read-only: boolean" (optional)

if true and "read-only" is false, QEMU may automatically decide not to open the image read-write as requested, but fall back to read-only instead (and switch between the modes later), e.g. depending on whether the image file is writable or whether a writing user is attached to the node (default: false, since 3.1)

"detect-zeroes: BlockdevDetectZeroesOptions" (optional)

detect and optimize zero writes (Since 2.1) (default: off)

"force-share: boolean" (optional)

force share all permission on added nodes. Requires read-only=true. (Since 2.10)

The members of "BlockdevOptionsBlkdebug" when "driver" is "blkdebug"

Since: 2.9 BlockdevRef (Alternate) Reference to a block device. Members: "definition: BlockdevOptions" defines a new block device inline "reference: string" references the ID of an existing block device Since: 2.9 BlockdevRefOrNull (Alternate) Reference to a block device. Members: "definition: BlockdevOptions" defines a new block device inline "reference: string" references the ID of an existing block device. An empty string means that no block device should be referenced. Deprecated; use null instead. "null: null" No block device should be referenced (since 2.10) Since: 2.9

blockdev-add (Command) Creates a new block device. If the "id" option is given at

the top level, a BlockBackend will be created; otherwise, "node-name" is mandatory

Page 112/325

at the top level and no BlockBackend will be created.

Arguments: the members of "BlockdevOptions"

```
Since: 2.9
Example:
```

```
1.
-> { "execute": "blockdev-add",
   "arguments": {
       "driver": "qcow2",
       "node-name": "test1",
       "file": {
         "driver": "file",
         "filename": "test.qcow2"
       }
    }
  }
<- { "return": {} }
2.
-> { "execute": "blockdev-add",
   "arguments": {
       "driver": "qcow2",
       "node-name": "node0",
       "discard": "unmap",
       "cache": {
         "direct": true
       },
        "file": {
         "driver": "file",
         "filename": "/tmp/test.qcow2"
       },
       "backing": {
         "driver": "raw",
         "file": {
            "driver": "file",
```

```
"filename": "/dev/fdset/4"
}
}
}
<- { "return": {} }
```

x-blockdev-reopen (Command) Reopens a block device using the given set of options.

Any option not specified will be reset to its default value regardless of its

previous status. If an option cannot be changed or a particular driver does not support reopening then the command will return an error.

The top-level "node-name" option (from BlockdevOptions) must be specified and is used to select the block device to be reopened. Other "node-name" options must be either omitted or set to the current name of the appropriate node. This command won't change any node name and any attempt to do it will result in an error. In the case of options that refer to child nodes, the behavior of this command depends on the value:

- 1) A set of options (BlockdevOptions): the child is reopened with the specified set of options.
- 2) A reference to the current child: the child is reopened using its existing set of options.
- 3) A reference to a different node: the current child is replaced with the specified one.
- 4) NULL: the current child (if any) is detached.

Options (1) and (2) are supported in all cases, but at the moment only "backing" allows replacing or detaching an existing child.

Unlike with blockdev-add, the "backing" option must always be present unless the node being reopened does not have a backing file and its image does not have a default backing file name as part of its metadata.

Arguments: the members of "BlockdevOptions"

Since: 4.0

blockdev-del (Command) Deletes a block device that has been added using blockdevadd. The command will fail if the node is attached to a device or is otherwise being used.

```
Arguments:
"node-name: string"
  Name of the graph node to delete.
Since: 2.9
Example:
     -> { "execute": "blockdev-add",
        "arguments": {
           "driver": "qcow2",
           "node-name": "node0",
           "file": {
              "driver": "file",
              "filename": "test.qcow2"
           }
        }
      }
     <- { "return": {} }
     -> { "execute": "blockdev-del",
        "arguments": { "node-name": "node0" }
      }
     <- { "return": {} }
BlockdevCreateOptionsFile (Object)
Driver specific image creation options for file.
"filename"
                Filename for the new image file "size"
                                                              Size of the
virtual disk in bytes "preallocation" Preallocation mode for the new image
(default: off; allowed values: off, falloc (if defined CONFIG_POSIX_FALLOCATE),
full (if defined CONFIG_POSIX)) "nocow"
                                                 Turn off copy-on-write (valid
only on btrfs; default: off)

BlockdevQcow2Version (Enum)

Values:

"v2"

The original QCOW2 format as introduced in gemu 0.10 (version 2)

"v3"

The extended QCOW2 format as introduced in qemu 1.1 (version 3)

Since: 2.12

BlockdevCreateOptionsQcow2 (Object)

Driver specific image creation options for qcow2.

"file" Node to create the image format on "data-file" Node to use as an external data file in which all guest data is stored so that only

use as an external data life in which all guest data is stored so that only

metadata remains in the qcow2 file (since: 4.0) "data-file-raw" True if the

external data file must stay valid as a standalone (read-only) raw image without

looking at qcow2 metadata (default: false; since: 4.0) "size" Size of

the virtual disk in bytes "version" Compatibility level (default: v3)

"backing-file" File name of the backing file if a backing file should be used

"backing-fmt" Name of the block driver to use for the backing file "encrypt"

Encryption options if the image should be encrypted "cluster-size" qcow2

cluster size in bytes (default: 65536) "preallocation" Preallocation mode for

the new image (default: off; allowed values: off, falloc, full, metadata)

"lazy-refcounts" True if refcounts may be updated lazily (default: off)

"refcount-bits" Width of reference counts in bits (default: 16)

"location" Where to store the new image file. This location cannot point to a snapshot. "size" Size of the virtual disk in bytes "cluster-size" RBD object size Members: "location: BlockdevOptionsRbd" Not documented "size: int" Not documented "cluster-size: int" (optional) Not documented Since: 2.12 BlockdevVmdkSubformat (Enum) Subformat options for VMDK images Values: "monolithicSparse" Single file image with sparse cluster allocation "monolithicFlat" Single flat data image and a descriptor file "twoGbMaxExtentSparse" Data is split into 2GB (per virtual LBA) sparse extent files, in addition to a descriptor file "twoGbMaxExtentFlat" Data is split into 2GB (per virtual LBA) flat extent files, in addition to a

descriptor file

Page 120/325

"streamOptimized"

Single file image sparse cluster allocation, optimized for streaming over network.

Since: 4.0

BlockdevVmdkAdapterType (Enum)

Adapter type info for VMDK images

Values:

"ide"

Not documented

"buslogic"

Not documented

"Isilogic"

Not documented

"legacyESX"

Not documented

Since: 4.0

BlockdevCreateOptionsVmdk (Object)

Driver specific image creation options for VMDK.

"file" Where to store the new image file. This refers to the image file for monolithcSparse and streamOptimized format, or the descriptor file for other formats. "size" Size of the virtual disk in bytes "extents" Where to store the data extents. Required for monolithcFlat, twoGbMaxExtentSparse and twoGbMaxExtentFlat formats. For monolithicFlat, only one entry is required; for twoGbMaxExtent\* formats, the number of entries required is calculated as extent\_number = virtual\_size / 2GB. Providing more extents than will be used is an error. "subformat" The subformat of the VMDK image. Default: "monolithicSparse". "backing-file" The path of backing file. Default: no backing file is used. "adapter-type" The adapter type used to fill in the descriptor. Default: ide. "hwversion" Hardware version. The meaningful options are "4" or "6". Default: "4". "zeroed-grain" Whether to enable zeroed-grain feature for sparse subformats. Default: false.

The members of "BlockdevCreateOptionsVpc" when "driver" is "vpc"

Since: 2.12

blockdev-create (Command) Starts a job to create an image format on a given node.

The job is automatically finalized, but a manual job-dismiss is required.

Arguments:

"job-id: string"

Identifier for the newly created job.

"options: BlockdevCreateOptions"

Options for the image creation.

Since: 3.0

blockdev-open-tray (Command) Opens a block device's tray. If there is a block driver state tree inserted as a medium, it will become inaccessible to the guest (but it will remain associated to the block device, so closing the tray will make it accessible again).

If the tray was already open before, this will be a no-op.

Once the tray opens, a DEVICE\_TRAY\_MOVED event is emitted. There are cases in which no such event will be generated, these include:

- if the guest has locked the tray, "force" is false and the guest does not respond to the eject request
- if the BlockBackend denoted by "device" does not have a guest device attached to it
- if the guest device does not have an actual tray

Arguments:

"device: string" (optional)

Block device name (deprecated, use "id" instead)

"id: string" (optional)

The name or QOM path of the guest device (since: 2.8)

"force: boolean" (optional)

if false (the default), an eject request will be sent to the guest if it has locked the tray (and the tray will not be opened immediately); if true, the

tray will be opened regardless of whether it is locked

Since: 2.5

Example:

```
"arguments": { "id": "ide0-1-0" } }
     <- { "timestamp": { "seconds": 1418751016,
                 "microseconds": 716996 },
        "event": "DEVICE_TRAY_MOVED",
        "data": { "device": "ide1-cd0",
              "id": "ide0-1-0",
              "tray-open": true } }
     <- { "return": {} }
blockdev-close-tray (Command) Closes a block device's tray. If there is a block
driver state tree associated with the block device (which is currently ejected),
that tree will be loaded as the medium.
If the tray was already closed before, this will be a no-op.
Arguments:
"device: string" (optional)
  Block device name (deprecated, use "id" instead)
"id: string" (optional)
  The name or QOM path of the guest device (since: 2.8)
Since: 2.5
Example:
     -> { "execute": "blockdev-close-tray",
        "arguments": { "id": "ide0-1-0" } }
     <- { "timestamp": { "seconds": 1418751345,
                  "microseconds": 272147 },
        "event": "DEVICE_TRAY_MOVED",
        "data": { "device": "ide1-cd0",
              "id": "ide0-1-0",
              "tray-open": false } }
     <- { "return": {} }
blockdev-remove-medium (Command) Removes a medium (a block driver state tree) from
a block device. That block device's tray must currently be open (unless there is no
attached guest device).
If the tray is open and there is no medium inserted, this will be a no-op.
```

Arguments: Page 128/325

```
"id: string"
  The name or QOM path of the guest device
Since: 2.12
Example:
    -> { "execute": "blockdev-remove-medium",
        "arguments": { "id": "ide0-1-0" } }
     <- { "error": { "class": "GenericError",
               "desc": "Tray of device 'ide0-1-0' is not open" } }
     -> { "execute": "blockdev-open-tray",
        "arguments": { "id": "ide0-1-0" } }
     <- { "timestamp": { "seconds": 1418751627,
                 "microseconds": 549958 },
        "event": "DEVICE_TRAY_MOVED",
        "data": { "device": "ide1-cd0",
              "id": "ide0-1-0",
              "tray-open": true } }
     <- { "return": {} }
     -> { "execute": "blockdev-remove-medium",
        "arguments": { "id": "ide0-1-0" } }
     <- { "return": {} }
blockdev-insert-medium (Command) Inserts a medium (a block driver state tree) into
a block device. That block device's tray must currently be open (unless there is no
attached guest device) and there must be no medium inserted already.
Arguments:
"id: string"
  The name or QOM path of the guest device
"node-name: string"
  name of a node in the block driver state graph
Since: 2.12
Example:
    -> { "execute": "blockdev-add",
```

"arguments": {

"node-name": "node0",

```
"driver": "raw",
          "file": { "driver": "file",
                "filename": "fedora.iso" } } }
     <- { "return": {} }
     -> { "execute": "blockdev-insert-medium",
        "arguments": { "id": "ide0-1-0",
                 "node-name": "node0" } }
     <- { "return": {} }
BlockdevChangeReadOnlyMode (Enum)
Specifies the new read-only mode of a block device subject to the
"blockdev-change-medium" command.
Values:
"retain"
  Retains the current read-only mode
"read-only"
  Makes the device read-only
"read-write"
  Makes the device writable
Since: 2.3
blockdev-change-medium (Command) Changes the medium inserted into a block device
by ejecting the current medium and loading a new image file which is inserted as
the new medium (this command combines blockdev-open-tray, blockdev-remove-medium,
blockdev-insert-medium and blockdev-close-tray).
Arguments:
"device: string" (optional)
  Block device name (deprecated, use "id" instead)
"id: string" (optional)
  The name or QOM path of the guest device (since: 2.8)
"filename: string"
  filename of the new image to be loaded
"format: string" (optional)
  format to open the new image with (defaults to the probed format)
"read-only-mode: BlockdevChangeReadOnlyMode" (optional)
```

## Since: 2.5

Examples:

```
1. Change a removable medium
     -> { "execute": "blockdev-change-medium",
        "arguments": { "id": "ide0-1-0",
                  "filename": "/srv/images/Fedora-12-x86_64-DVD.iso",
                  "format": "raw" } }
     <- { "return": {} }
     2. Load a read-only medium into a writable drive
     -> { "execute": "blockdev-change-medium",
        "arguments": { "id": "floppyA",
                  "filename": "/srv/images/ro.img",
                  "format": "raw",
                  "read-only-mode": "retain" } }
     <- { "error":
        { "class": "GenericError",
         "desc": "Could not open '/srv/images/ro.img': Permission denied" } }
     -> { "execute": "blockdev-change-medium",
        "arguments": { "id": "floppyA",
                  "filename": "/srv/images/ro.img",
                  "format": "raw",
                  "read-only-mode": "read-only" } }
     <- { "return": {} }
BlockErrorAction (Enum)
An enumeration of action that has been taken when a DISK I/O occurs
Values:
"ignore"
  error has been ignored
"report"
  error has been reported to the device
"stop"
```

```
Since: 2.1
```

```
BLOCK IMAGE CORRUPTED (Event) Emitted when a disk image is being marked corrupt.
The image can be identified by its device or node name. The 'device' field is
always present for compatibility reasons, but it can be empty ("") if the image
does not have a device name associated.
Arguments:
"device: string"
  device name. This is always present for compatibility reasons, but it can be
  empty ("") if the image does not have a device name associated.
"node-name: string" (optional)
  node name (Since: 2.4)
"msg: string"
  informative message for human consumption, such as the kind of corruption being
  detected. It should not be parsed by machine as it is not guaranteed to be
  stable
"offset: int" (optional)
  if the corruption resulted from an image access, this is the host's access
  offset into the image
"size: int" (optional)
  if the corruption resulted from an image access, this is the access size
"fatal: boolean"
  if set, the image is marked corrupt and therefore unusable after this event and
  must be repaired (Since 2.2; before, every BLOCK_IMAGE_CORRUPTED event was
  fatal)
Note: If action is "stop", a STOP event will eventually follow the BLOCK_IO_ERROR
event.
Example:
     <- { "event": "BLOCK_IMAGE_CORRUPTED",
        "data": { "device": "ide0-hd0", "node-name": "node0",
              "msg": "Prevented active L1 table overwrite", "offset": 196608,
              "size": 65536 },
        "timestamp": { "seconds": 1378126126, "microseconds": 966463 } }
```

Since: 1.7 Page 132/325

```
BLOCK IO ERROR (Event) Emitted when a disk I/O error occurs
Arguments:
"device: string"
  device name. This is always present for compatibility reasons, but it can be
  empty ("") if the image does not have a device name associated.
"node-name: string" (optional)
  node name. Note that errors may be reported for the root node that is directly
  attached to a guest device rather than for the node where the error occurred.
  The node name is not present if the drive is empty. (Since: 2.8)
"operation: IoOperationType"
  I/O operation
"action: BlockErrorAction"
  action that has been taken
"nospace: boolean" (optional)
  true if I/O error was caused due to a no-space condition. This key is only
  present if query-block's io-status is present, please see query-block
  documentation for more information (since: 2.2)
"reason: string"
  human readable string describing the error cause. (This field is a debugging
  aid for humans, it should not be parsed by applications) (since: 2.2)
Note: If action is "stop", a STOP event will eventually follow the BLOCK_IO_ERROR
event
Since: 0.13.0
Example:
     <- { "event": "BLOCK_IO_ERROR",
        "data": { "device": "ide0-hd1",
              "node-name": "#block212",
              "operation": "write",
              "action": "stop" },
        "timestamp": { "seconds": 1265044230, "microseconds": 450486 } }
BLOCK_JOB_COMPLETED (Event) Emitted when a block job has completed
Arguments:
```

"type: JobType"

Page 133/325

```
job type
"device: string"
  The job identifier. Originally the device name but other values are allowed
  since QEMU 2.7
"len: int"
  maximum progress value
"offset: int"
  current progress value. On success this is equal to len. On failure this is
  less than len
"speed: int"
  rate limit, bytes per second
"error: string" (optional)
  error message. Only present on failure. This field contains a human-readable
  error message. There are no semantics other than that streaming has failed and
  clients should not try to interpret the error string
Since: 1.1
Example:
     <- { "event": "BLOCK_JOB_COMPLETED",
        "data": { "type": "stream", "device": "virtio-disk0",
              "len": 10737418240, "offset": 10737418240,
              "speed": 0 },
        "timestamp": { "seconds": 1267061043, "microseconds": 959568 } }
BLOCK_JOB_CANCELLED (Event) Emitted when a block job has been cancelled
Arguments:
"type: JobType"
  job type
"device: string"
  The job identifier. Originally the device name but other values are allowed
  since QEMU 2.7
"len: int"
  maximum progress value
"offset: int"
```

current progress value. On success this is equal to len. On failure this is

```
less than len
"speed: int"
  rate limit, bytes per second
Since: 1.1
Example:
    <- { "event": "BLOCK_JOB_CANCELLED",
       "data": { "type": "stream", "device": "virtio-disk0",
              "len": 10737418240, "offset": 134217728,
              "speed": 0 },
        "timestamp": { "seconds": 1267061043, "microseconds": 959568 } }
BLOCK_JOB_ERROR (Event) Emitted when a block job encounters an error
Arguments:
"device: string"
  The job identifier. Originally the device name but other values are allowed
  since QEMU 2.7
"operation: IoOperationType"
  I/O operation
"action: BlockErrorAction"
  action that has been taken
Since: 1.3
Example:
    <- { "event": "BLOCK_JOB_ERROR",
        "data": { "device": "ide0-hd1",
              "operation": "write",
              "action": "stop" },
        "timestamp": { "seconds": 1265044230, "microseconds": 450486 } }
BLOCK_JOB_READY (Event) Emitted when a block job is ready to complete
Arguments:
"type: JobType"
  job type
"device: string"
  The job identifier. Originally the device name but other values are allowed
```

since QEMU 2.7 Page 135/325

```
"len: int"
  maximum progress value
"offset: int"
  current progress value. On success this is equal to len. On failure this is
  less than len
"speed: int"
  rate limit, bytes per second
Note: The "ready to complete" status is always reset by a "BLOCK_JOB_ERROR" event
Since: 1.3
Example:
     <- { "event": "BLOCK_JOB_READY",
        "data": { "device": "drive0", "type": "mirror", "speed": 0,
              "len": 2097152, "offset": 2097152 }
        "timestamp": { "seconds": 1265044230, "microseconds": 450486 } }
BLOCK_JOB_PENDING (Event) Emitted when a block job is awaiting explicit
authorization to finalize graph changes via "block-job-finalize". If this job is
part of a transaction, it will not emit this event until the transaction has
converged first.
Arguments:
"type: JobType"
  job type
"id: string"
  The job identifier.
Since: 2.12
Example:
     <- { "event": "BLOCK_JOB_WAITING",
        "data": { "device": "drive0", "type": "mirror" },
        "timestamp": { "seconds": 1265044230, "microseconds": 450486 } }
PreallocMode (Enum)
Preallocation mode of QEMU image file
Values:
"off"
```

no preallocation Page 136/325

"metadata"

preallocate only for metadata

"falloc"

like "full" preallocation but allocate disk space by posix\_fallocate() rather than writing data.

"full"

preallocate all data by writing it to the device to ensure disk space is really available. This data may or may not be zero, depending on the image format and storage. "full" preallocation also sets up metadata correctly.

Since: 2.2

BLOCK\_WRITE\_THRESHOLD (Event) Emitted when writes on block device reaches or exceeds the configured write threshold. For thin-provisioned devices, this means the device should be extended to avoid pausing for disk exhaustion. The event is one shot. Once triggered, it needs to be re-registered with another block-setwrite-threshold command.

Arguments:

"node-name: string"

graph node name on which the threshold was exceeded.

"amount-exceeded: int"

amount of data which exceeded the threshold, in bytes.

"write-threshold: int"

last configured threshold, in bytes.

Since: 2.3

block-set-write-threshold (Command) Change the write threshold for a block drive.

An event will be delivered if a write to this block drive crosses the configured threshold. The threshold is an offset, thus must be non-negative. Default is no

write threshold. Setting the threshold to zero disables it.

This is useful to transparently resize thin-provisioned drives without the guest OS noticing.

Arguments:

"node-name: string"

graph node name on which the threshold must be set.

"write-threshold: int"

Page 137/325

x-blockdev-change (Command) Dynamically reconfigure the block driver state graph. It can be used to add, remove, insert or replace a graph node. Currently only the Quorum driver implements this feature to add or remove its child. This is useful to fix a broken quorum child.

If "node" is specified, it will be inserted under "parent". "child" may not be specified in this case. If both "parent" and "child" are specified but "node" is not, "child" will be detached from "parent".

Arguments:

"parent: string"

the id or name of the parent node.

"child: string" (optional)

<- { "return": {} }

the name of a child under the given parent node.

"node: string" (optional)

the name of the node that will be added.

Note: this command is experimental, and its API is not stable. It does not support all kinds of operations, all kinds of children, nor all block drivers.

FIXME Removing children from a quorum node means introducing gaps in the child indices. This cannot be represented in the 'children' list of

BlockdevOptionsQuorum, as returned by .bdrv\_refresh\_filename().

Warning: The data in a new quorum child MUST be consistent with that of the rest of the array.

Since: 2.7

Example:

1. Add a new node to a quorum

```
-> { "execute": "blockdev-add",
```

```
"arguments": {
           "driver": "raw",
           "node-name": "new_node",
           "file": { "driver": "file",
                 "filename": "test.raw" } } }
     <- { "return": {} }
     -> { "execute": "x-blockdev-change",
        "arguments": { "parent": "disk1",
                  "node": "new_node" } }
     <- { "return": {} }
     2. Delete a quorum's node
     -> { "execute": "x-blockdev-change",
        "arguments": { "parent": "disk1",
                  "child": "children.1" } }
     <- { "return": {} }
x-blockdev-set-iothread (Command) Move "node" and its children into the
"iothread". If "iothread" is null then move "node" and its children into the main
loop.
The node must not be attached to a BlockBackend.
Arguments:
"node-name: string"
  the name of the block driver node
"iothread: StrOrNull"
  the name of the IOThread object or null for the main loop
"force: boolean" (optional)
  true if the node and its children should be moved when a BlockBackend is
  already attached
Note: this command is experimental and intended for test cases that need control
over IOThreads only.
Since: 2.12
Example:
     1. Move a node into an IOThread
```

-> { "execute": "x-blockdev-set-iothread",

```
"arguments": { "node-name": "disk1",
                 "iothread": "iothread0" } }
     <- { "return": {} }
     2. Move a node into the main loop
     -> { "execute": "x-blockdev-set-iothread",
        "arguments": { "node-name": "disk1",
                 "iothread": null } }
     <- { "return": {} }
Additional block stuff (VM related)
BiosAtaTranslation (Enum)
Policy that BIOS should use to interpret cylinder/head/sector addresses. Note that
Bochs BIOS and SeaBIOS will not actually translate logical CHS to physical;
instead, they will use logical block addressing.
Values:
"auto"
  If cylinder/heads/sizes are passed, choose between none and LBA depending on
  the size of the disk. If they are not passed, choose none if QEMU can guess
  that the disk had 16 or fewer heads, large if QEMU can guess that the disk had
  131072 or fewer tracks across all heads (i.e. cylinders*heads<131072),
  otherwise LBA.
  The physical disk geometry is equal to the logical geometry.
```

"none"

"lba"

Assume 63 sectors per track and one of 16, 32, 64, 128 or 255 heads (if fewer than 255 are enough to cover the whole disk with 1024 cylinders/head). The number of cylinders/head is then computed based on the number of sectors and heads.

"large"

The number of cylinders per head is scaled down to 1024 by correspondingly scaling up the number of heads.

"rechs"

Same as "large", but first convert a 16-head geometry to 15-head, by proportionally scaling up the number of cylinders/head.

Since: 2.0 FloppyDriveType (Enum) Type of Floppy drive to be emulated by the Floppy Disk Controller. Values: 144 1.44MB 3.5" drive 288 2.88MB 3.5" drive 120 1.2MB 5.25" drive "none" No drive connected "auto" Automatically determined by inserted media at boot Since: 2.6 BlockdevSnapshotInternal (Object) Members: "device: string" the device name or node-name of a root node to generate the snapshot from "name: string" the name of the internal snapshot to be created Notes: In transaction, if "name" is empty, or any snapshot matching "name" exists, the operation will fail. Only some image formats support it, for example, qcow2, rbd, and sheepdog. Since: 1.7 PRManagerInfo (Object) Information about a persistent reservation manager Members: "id: string" the identifier of the persistent reservation manager "connected: boolean" true if the persistent reservation manager is connected to the underlying storage or helper Since: 3.0 query-pr-managers (Command) Returns a list of information about each persistent

reservation manager.

Returns: a list of "PRManagerInfo" for each persistent reservation manager

Since: 3.0

blockdev-snapshot-internal-sync (Command) Synchronously take an internal snapshot of a block device, when the format of the image used supports it. If the name is an empty string, or a snapshot with name already exists, the operation will fail.

For the arguments, see the documentation of BlockdevSnapshotInternal.

Returns: nothing on success

If "device" is not a valid block device, GenericError

If any snapshot matching "name" exists, or "name" is empty, GenericError

If the format of the image used does not support it, BlockFormatFeatureNotSupported

Since: 1.7

## Example:

blockdev-snapshot-delete-internal-sync (Command) Synchronously delete an internal snapshot of a block device, when the format of the image used support it. The snapshot is identified by name or id or both. One of the name or id is required.

Return SnapshotInfo for the successfully deleted snapshot.

Arguments:

"device: string"

the device name or node-name of a root node to delete the snapshot from

"id: string" (optional)

optional the snapshot's ID to be deleted

"name: string" (optional)

optional the snapshot's name to be deleted

Returns: SnapshotInfo on success If "device" is not a valid block device,

GenericError If snapshot not found, GenericError If the format of the image used does not support it, BlockFormatFeatureNotSupported If "id" and "name" are both not specified, GenericError

Since: 1.7 Page 142/325

```
Example:
```

```
-> { "execute": "blockdev-snapshot-delete-internal-sync",
        "arguments": { "device": "ide-hd0",
                  "name": "snapshot0" }
      }
     <- { "return": {
                 "id": "1",
                 "name": "snapshot0",
                 "vm-state-size": 0,
                 "date-sec": 1000012,
                 "date-nsec": 10,
                 "vm-clock-sec": 100,
                 "vm-clock-nsec": 20
        }
      }
eject (Command) Ejects a device from a removable drive.
Arguments:
"device: string" (optional)
  Block device name (deprecated, use "id" instead)
"id: string" (optional)
  The name or QOM path of the guest device (since: 2.8)
"force: boolean" (optional)
  If true, eject regardless of whether the drive is locked. If not specified,
  the default value is false.
Returns: Nothing on success
If "device" is not a valid block device, DeviceNotFound
Notes: Ejecting a device with no media results in success
Since: 0.14.0
Example:
     -> { "execute": "eject", "arguments": { "id": "ide1-0-1" } }
     <- { "return": {} }
nbd-server-start (Command) Start an NBD server listening on the given host and
port. Block devices can then be exported using "nbd-server-add". The NBD server
```

```
will present them as named exports; for example, another QEMU instance could refer
to them as "nbd:HOST:PORT:exportname=NAME".
Arguments:
"addr: SocketAddressLegacy"
  Address on which to listen.
"tls-creds: string" (optional)
  ID of the TLS credentials object (since 2.6).
"tls-authz: string" (optional)
  ID of the QAuthZ authorization object used to validate the client's x509
  distinguished name. This object is is only resolved at time of use, so can be
  deleted and recreated on the fly while the NBD server is active. If missing,
  it will default to denying access (since 4.0).
Returns: error if the server is already running.
Since: 1.3.0
nbd-server-add (Command) Export a block node to QEMU's embedded NBD server.
Arguments:
"device: string"
  The device name or node name of the node to be exported
"name: string" (optional)
  Export name. If unspecified, the "device" parameter is used as the export name.
  (Since 2.12)
"writable: boolean" (optional)
  Whether clients should be able to write to the device via the NBD connection
  (default false).
"bitmap: string" (optional)
  Also export the dirty bitmap reachable from "device", so the NBD client can use
  NBD_OPT_SET_META_CONTEXT with "qemu:dirty-bitmap:NAME" to inspect the bitmap.
  (since 4.0)
Returns: error if the server is not running, or export with the same name already
exists.
Since: 1.3.0
NbdServerRemoveMode (Enum)
```

Mode for removing an NBD export.

Page 144/325

Values:

"safe"

Remove export if there are no existing connections, fail otherwise.

"hard"

Drop all connections immediately and remove export.

Potential additional modes to be added in the future:

hide: Just hide export from new clients, leave existing connections as is. Remove export after all clients are disconnected.

soft: Hide export from new clients, answer with ESHUTDOWN for all further requests from existing clients.

Since: 2.12

nbd-server-remove (Command) Remove NBD export by name.

Arguments:

"name: string"

Export name.

"mode: NbdServerRemoveMode" (optional)

Mode of command operation. See "NbdServerRemoveMode" description. Default is 'safe'.

Returns: error if

- the server is not running
- export is not found
- mode is 'safe' and there are existing connections

Since: 2.12

nbd-server-stop (Command) Stop QEMU's embedded NBD server, and unregister all devices previously added via "nbd-server-add".

Since: 1.3.0

DEVICE\_TRAY\_MOVED (Event) Emitted whenever the tray of a removable device is moved by the guest or by HMP/QMP commands

Arguments:

"device: string"

Block device name. This is always present for compatibility reasons, but it can be empty ("") if the image does not have a device name associated.

"id: string" Page 145/325

```
The name or QOM path of the guest device (since 2.8)
"tray-open: boolean"
  true if the tray has been opened or false if it has been closed
Since: 1.1
Example:
    <- { "event": "DEVICE_TRAY_MOVED",
       "data": { "device": "ide1-cd0",
              "id": "/machine/unattached/device[22]",
              "tray-open": true
       },
       "timestamp": { "seconds": 1265044230, "microseconds": 450486 } }
PR_MANAGER_STATUS_CHANGED (Event) Emitted whenever the connected status of a
persistent reservation manager changes.
Arguments:
"id: string"
  The id of the PR manager object
"connected: boolean"
  true if the PR manager is connected to a backend
Since: 3.0
Example:
    <- { "event": "PR_MANAGER_STATUS_CHANGED",
       "data": { "id": "pr-helper0",
              "connected": true
       },
       "timestamp": { "seconds": 1519840375, "microseconds": 450486 } }
QuorumOpType (Enum)
An enumeration of the quorum operation types
Values:
"read"
  read operation
"write"
  write operation
```

"flush"

```
flush operation
Since: 2.6
QUORUM_FAILURE (Event) Emitted by the Quorum block driver if it fails to establish
a quorum
Arguments:
"reference: string"
  device name if defined else node name
"sector-num: int"
  number of the first sector of the failed read operation
"sectors-count: int"
  failed read operation sector count
Note: This event is rate-limited.
Since: 2.0
Example:
     <- { "event": "QUORUM_FAILURE",
        "data": { "reference": "usr1", "sector-num": 345435, "sectors-count": 5 },
        "timestamp": { "seconds": 1344522075, "microseconds": 745528 } }
QUORUM_REPORT_BAD (Event) Emitted to report a corruption of a Quorum file
Arguments:
"type: QuorumOpType"
  quorum operation type (Since 2.6)
"error: string" (optional)
  error message. Only present on failure. This field contains a human-readable
  error message. There are no semantics other than that the block layer reported
  an error and clients should not try to interpret the error string.
"node-name: string"
  the graph node name of the block driver state
"sector-num: int"
  number of the first sector of the failed read operation
"sectors-count: int"
  failed read operation sector count
Note: This event is rate-limited.
```

Since: 2.0 Page 147/325

```
Example:
```

{

```
1. Read operation
       { "event": "QUORUM_REPORT_BAD",
          "data": { "node-name": "node0", "sector-num": 345435, "sectors-count": 5,
                "type": "read" },
          "timestamp": { "seconds": 1344522075, "microseconds": 745528 } }
       2. Flush operation
       { "event": "QUORUM_REPORT_BAD",
          "data": { "node-name": "node0", "sector-num": 0, "sectors-count": 2097120,
                "type": "flush", "error": "Broken pipe" },
          "timestamp": { "seconds": 1456406829, "microseconds": 291763 } }
Character devices
  ChardevInfo (Object)
  Information about a character device.
  Members:
  "label: string"
    the label of the character device
  "filename: string"
    the filename of the character device
  "frontend-open: boolean"
    shows whether the frontend device attached to this backend (eg. with the
    chardev=... option) is in open or closed state (since 2.1)
  Notes: "filename" is encoded using the QEMU command line character device encoding.
  See the QEMU man page for details.
  Since: 0.14.0
  query-chardev (Command) Returns information about current character devices.
  Returns: a list of "ChardevInfo"
  Since: 0.14.0
  Example:
       -> { "execute": "query-chardev" }
       <- {
           "return": [
```

```
"label": "charchannel0",
             "filename": "unix:/var/lib/libvirt/qemu/seabios.rhel6.agent,server",
             "frontend-open": false
          },
             "label": "charmonitor",
             "filename": "unix:/var/lib/libvirt/qemu/seabios.rhel6.monitor,server",
             "frontend-open": true
          },
             "label": "charserial0",
             "filename": "pty:/dev/pts/2",
             "frontend-open": true
          }
        ]
       }
ChardevBackendInfo (Object)
Information about a character device backend
Members:
"name: string"
  The backend name
Since: 2.0
query-chardev-backends (Command) Returns information about character device
backends.
Returns: a list of "ChardevBackendInfo"
Since: 2.0
Example:
     -> { "execute": "query-chardev-backends" }
     <- {
         "return":[
           {
             "name":"udp"
          },
```

```
"name":"tcp"
          },
            "name":"unix"
          },
          {
            "name": "spiceport"
      }
DataFormat (Enum)
An enumeration of data format.
Values:
"utf8"
  Data is a UTF-8 string (RFC 3629)
"base64"
  Data is Base64 encoded binary (RFC 3548)
Since: 1.4
ringbuf-write (Command) Write to a ring buffer character device.
Arguments:
"device: string"
  the ring buffer character device name
"data: string"
  data to write
"format: DataFormat" (optional)
  data encoding (default 'utf8').
  - base64: data must be base64 encoded text. Its binary decoding gets
    written.
  - utf8: data's UTF-8 encoding is written
  - data itself is always Unicode regardless of format, like any other string.
```

Returns: Nothing on success

Since: 1.4 Page 150/325

```
Example:
```

```
-> { "execute": "ringbuf-write",
        "arguments": { "device": "foo",
                 "data": "abcdefgh",
                  "format": "utf8" } }
     <- { "return": {} }
ringbuf-read (Command) Read from a ring buffer character device.
Arguments:
"device: string"
  the ring buffer character device name
"size: int"
  how many bytes to read at most
"format: DataFormat" (optional)
  data encoding (default 'utf8').
  - base64: the data read is returned in base64 encoding.
  - utf8: the data read is interpreted as UTF-8. Bug: can screw up when the
     buffer contains invalid UTF-8 sequences, NUL characters, after the ring
     buffer lost data, and when reading stops because the size limit is reached.
  - The return value is always Unicode regardless of format, like any other
     string.
Returns: data read from the device
Since: 1.4
Example:
     -> { "execute": "ringbuf-read",
        "arguments": { "device": "foo",
                  "size": 1000,
                  "format": "utf8" } }
     <- { "return": "abcdefgh" }
ChardevCommon (Object)
Configuration shared across all chardev backends
Members:
"logfile: string" (optional)
```

The name of a logfile to save output

"logappend: boolean" (optional) true to append instead of truncate (default to false to truncate) Since: 2.6 ChardevFile (Object) Configuration info for file chardevs. Members: "in: string" (optional) The name of the input file "out: string" The name of the output file "append: boolean" (optional) Open the file in append mode (default false to truncate) (Since 2.6) The members of "ChardevCommon" Since: 1.4 ChardevHostdev (Object) Configuration info for device and pipe chardevs. Members: "device: string" The name of the special file for the device, i.e. /dev/ttyS0 on Unix or COM1: on Windows The members of "ChardevCommon" Since: 1.4 ChardevSocket (Object) Configuration info for (stream) socket chardevs. Members: "addr: SocketAddressLegacy" socket address to listen on (server=true) or connect to (server=false) "tls-creds: string" (optional) the ID of the TLS credentials object (since 2.6) "tls-authz: string" (optional) the ID of the QAuthZ authorization object against which the client's x509 distinguished name will be validated. This object is only resolved at time of

use, so can be deleted and recreated on the fly while the chardev server is

```
active. If missing, it will default to denying access (since 4.0)
"server: boolean" (optional)
  create server socket (default: true)
"wait: boolean" (optional)
  wait for incoming connection on server sockets (default: false).
"nodelay: boolean" (optional)
  set TCP_NODELAY socket option (default: false)
"telnet: boolean" (optional)
  enable telnet protocol on server sockets (default: false)
"tn3270: boolean" (optional)
  enable tn3270 protocol on server sockets (default: false) (Since: 2.10)
"websocket: boolean" (optional)
  enable websocket protocol on server sockets (default: false) (Since: 3.1)
"reconnect: int" (optional)
  For a client socket, if a socket is disconnected, then attempt a reconnect
  after the given number of seconds. Setting this to zero disables this
  function. (default: 0) (Since: 2.2)
The members of "ChardevCommon"
Since: 1.4
ChardevUdp (Object)
Configuration info for datagram socket chardevs.
Members:
"remote: SocketAddressLegacy"
  remote address
"local: SocketAddressLegacy" (optional)
  local address
The members of "ChardevCommon"
Since: 1.5
ChardevMux (Object)
Configuration info for mux chardevs.
Members:
"chardev: string"
```

name of the base chardev.

```
The members of "ChardevCommon"
Since: 1.5
ChardevStdio (Object)
Configuration info for stdio chardevs.
Members:
"signal: boolean" (optional)
  Allow signals (such as SIGINT triggered by ^C) be delivered to qemu. Default:
  true in -nographic mode, false otherwise.
The members of "ChardevCommon"
Since: 1.5
ChardevSpiceChannel (Object)
Configuration info for spice vm channel chardevs.
Members:
"type: string"
  kind of channel (for example vdagent).
The members of "ChardevCommon"
Since: 1.5
If: "defined(CONFIG_SPICE)"
ChardevSpicePort (Object)
Configuration info for spice port chardevs.
Members:
"fqdn: string"
  name of the channel (see docs/spice-port-fqdn.txt)
The members of "ChardevCommon"
Since: 1.5
If: "defined(CONFIG_SPICE)"
ChardevVC (Object)
Configuration info for virtual console chardevs.
Members:
"width: int" (optional)
  console width, in pixels
"height: int" (optional)
```

console height, in pixels

```
"cols: int" (optional)
  console width, in chars
"rows: int" (optional)
  console height, in chars
The members of "ChardevCommon"
Since: 1.5
ChardevRingbuf (Object)
Configuration info for ring buffer chardevs.
Members:
"size: int" (optional)
  ring buffer size, must be power of two, default is 65536
The members of "ChardevCommon"
Since: 1.5
ChardevBackend (Object)
Configuration info for the new chardev backend.
Members:
"type"
  One of "file", "serial", "parallel", "pipe", "socket", "udp", "pty", "null",
  "mux", "msmouse", "wctablet", "braille", "testdev", "stdio", "console",
  "spicevmc", "spiceport", "vc", "ringbuf", "memory"
"data: ChardevFile" when "type" is "file"
"data: ChardevHostdev" when "type" is "serial"
"data: ChardevHostdev" when "type" is "parallel"
"data: ChardevHostdev" when "type" is "pipe"
"data: ChardevSocket" when "type" is "socket"
"data: ChardevUdp" when "type" is "udp"
"data: ChardevCommon" when "type" is "pty"
"data: ChardevCommon" when "type" is "null"
"data: ChardevMux" when "type" is "mux"
"data: ChardevCommon" when "type" is "msmouse"
"data: ChardevCommon" when "type" is "wctablet"
"data: ChardevCommon" when "type" is "braille"
```

"data: ChardevCommon" when "type" is "testdev"

```
"data: ChardevStdio" when "type" is "stdio"
"data: ChardevCommon" when "type" is "console"
"data: ChardevSpiceChannel" when "type" is "spicevmc" (If: "defined(CONFIG_SPICE)")
"data: ChardevSpicePort" when "type" is "spiceport" (If: "defined(CONFIG_SPICE)")
"data: ChardevVC" when "type" is "vc"
"data: ChardevRingbuf" when "type" is "ringbuf"
"data: ChardevRingbuf" when "type" is "memory"
Since: 1.4 (testdev since 2.2, wctablet since 2.9)
ChardevReturn (Object)
Return info about the chardev backend just created.
Members:
"pty: string" (optional)
  name of the slave pseudoterminal device, present if and only if a chardev of
  type 'pty' was created
Since: 1.4
chardev-add (Command) Add a character device backend
Arguments:
"id: string"
  the chardev's ID, must be unique
"backend: ChardevBackend"
  backend type and parameters
Returns: ChardevReturn.
Since: 1.4
Example:
     -> { "execute" : "chardev-add",
        "arguments": { "id": "foo",
                  "backend" : { "type" : "null", "data" : {} } } }
     <- { "return": {} }
     -> { "execute" : "chardev-add",
        "arguments" : { "id" : "bar",
                  "backend": { "type": "file",
                           "data" : { "out" : "/tmp/bar.log" } } } }
```

<- { "return": {} }

```
-> { "execute" : "chardev-add",
        "arguments" : { "id" : "baz",
                   "backend" : { "type" : "pty", "data" : {} } } }
     <- { "return": { "pty" : "/dev/pty/42" } }
chardev-change (Command) Change a character device backend
Arguments:
"id: string"
  the chardev's ID, must exist
"backend: ChardevBackend"
  new backend type and parameters
Returns: ChardevReturn.
Since: 2.10
Example:
     -> { "execute" : "chardev-change",
        "arguments" : { "id" : "baz",
                   "backend" : { "type" : "pty", "data" : {} } }
     <- { "return": { "pty" : "/dev/pty/42" } }
     -> {"execute" : "chardev-change",
       "arguments" : {
          "id": "charchannel2",
          "backend" : {
             "type": "socket",
             "data" : {
               "addr" : {
                  "type": "unix",
                  "data" : {
                     "path": "/tmp/charchannel2.socket"
                  }
                },
                "server": true,
                "wait" : false }}}}
     <- {"return": {}}
```

```
Arguments:
  "id: string"
    the chardev's ID, must exist and not be in use
  Returns: Nothing on success
  Since: 1.4
  Example:
       -> { "execute": "chardev-remove", "arguments": { "id" : "foo" } }
       <- { "return": {} }
  chardev-send-break (Command) Send a break to a character device
  Arguments:
  "id: string"
    the chardev's ID, must exist
  Returns: Nothing on success
  Since: 2.10
  Example:
       -> { "execute": "chardev-send-break", "arguments": { "id" : "foo" } }
       <- { "return": {} }
  VSERPORT_CHANGE (Event) Emitted when the guest opens or closes a virtio-serial
  port.
  Arguments:
  "id: string"
    device identifier of the virtio-serial port
  "open: boolean"
    true if the guest has opened the virtio-serial port
  Since: 2.1
  Example:
       <- { "event": "VSERPORT_CHANGE",
          "data": { "id": "channel0", "open": true },
          "timestamp": { "seconds": 1401385907, "microseconds": 422329 } }
Dump guest memory
  DumpGuestMemoryFormat (Enum)
  An enumeration of guest-memory-dump's format.
```

Values:

Page 158/325

"elf"

elf format

"kdump-zlib"

kdump-compressed format with zlib-compressed

"kdump-lzo"

kdump-compressed format with Izo-compressed

"kdump-snappy"

kdump-compressed format with snappy-compressed

"win-dmp"

Windows full crashdump format, can be used instead of ELF converting (since

2.13)

Since: 2.0

dump-guest-memory (Command) Dump guest's memory to vmcore. It is a synchronous operation that can take very long depending on the amount of guest memory.

Arguments:

"paging: boolean"

if true, do paging to get guest's memory mapping. This allows using gdb to process the core file.

IMPORTANT: this option can make QEMU allocate several gigabytes of RAM. This can happen for a large guest, or a malicious guest pretending to be large.

Also, paging=true has the following limitations:

- The guest may be in a catastrophic state or can have corrupted memory, which cannot be trusted
- The guest can be in real-mode even if paging is enabled. For example, the guest uses ACPI to sleep, and ACPI sleep state goes in real-mode
- 3. Currently only supported on i386 and x86\_64.

"protocol: string"

the filename or file descriptor of the vmcore. The supported protocols are:

- file: the protocol starts with "file:", and the following string is the file's path.
- 2. fd: the protocol starts with "fd:", and the following string is the fd's name.

"detach: boolean" (optional)

```
if true, QMP will return immediately rather than waiting for the dump to
  finish. The user can track progress using "query-dump". (since 2.6).
"begin: int" (optional)
  if specified, the starting physical address.
"length: int" (optional)
  if specified, the memory size, in bytes. If you don't want to dump all guest's
  memory, please specify the start "begin" and "length"
"format: DumpGuestMemoryFormat" (optional)
  if specified, the format of guest memory dump. But non-elf format is conflict
  with paging and filter, ie. "paging", "begin" and "length" is not allowed to be
  specified with non-elf "format" at the same time (since 2.0)
Note: All boolean arguments default to false
Returns: nothing on success
Since: 1.2
Example:
    -> { "execute": "dump-guest-memory",
        "arguments": { "protocol": "fd:dump" } }
     <- { "return": {} }
DumpStatus (Enum)
Describe the status of a long-running background guest memory dump.
Values:
"none"
  no dump-guest-memory has started yet.
"active"
  there is one dump running in background.
"completed"
  the last dump has finished successfully.
"failed"
  the last dump has failed.
Since: 2.6
DumpQueryResult (Object)
The result format for 'query-dump'.
```

Members: Page 160/325

```
"status: DumpStatus"
  enum of "DumpStatus", which shows current dump status
"completed: int"
  bytes written in latest dump (uncompressed)
"total: int"
  total bytes to be written in latest dump (uncompressed)
Since: 2.6
query-dump (Command) Query latest dump status.
Returns: A "DumpStatus" object showing the dump status.
Since: 2.6
Example:
    -> { "execute": "query-dump" }
    <- { "return": { "status": "active", "completed": 1024000,
               "total": 2048000 } }
DUMP_COMPLETED (Event) Emitted when background dump has completed
Arguments:
"result: DumpQueryResult"
  final dump status
"error: string" (optional)
  human-readable error string that provides hint on why dump failed. Only
  presents on failure. The user should not try to interpret the error string.
Since: 2.6
Example:
    { "event": "DUMP_COMPLETED",
      "data": {"result": {"total": 1090650112, "status": "completed",
                  "completed": 1090650112} } }
DumpGuestMemoryCapability (Object)
A list of the available formats for dump-guest-memory
Members:
"formats: array of DumpGuestMemoryFormat"
  Not documented
Since: 2.0
```

```
dump-guest-memory
  Returns: A "DumpGuestMemoryCapability" object listing available formats for dump-
  guest-memory
  Since: 2.0
  Example:
       -> { "execute": "query-dump-guest-memory-capability" }
       <- { "return": { "formats":
                 ["elf", "kdump-zlib", "kdump-lzo", "kdump-snappy"] }
Net devices
  set_link (Command) Sets the link status of a virtual network adapter.
  Arguments:
  "name: string"
    the device name of the virtual network adapter
  "up: boolean"
    true to set the link status to be up
  Returns: Nothing on success If "name" is not a valid network device, DeviceNotFound
  Since: 0.14.0
  Notes: Not all network adapters support setting link status. This command will
  succeed even if the network adapter does not support link status notification.
  Example:
       -> { "execute": "set_link",
          "arguments": { "name": "e1000.0", "up": false } }
       <- { "return": {} }
  netdev_add (Command) Add a network backend.
  Arguments:
  "type: string"
    the type of network backend. Possible values are listed in NetClientDriver
    (excluding 'none' and 'nic')
  "id: string"
    the name of the new network backend
  Additional arguments depend on the type.
  TODO: This command effectively bypasses QAPI completely due to its "additional
  arguments" business. It shouldn't have been added to the schema in this form. It
```

should be gapified properly, or replaced by a properly gapified command. Since: 0.14.0 Returns: Nothing on success If "type" is not a valid network backend, DeviceNotFound Example: -> { "execute": "netdev\_add", "arguments": { "type": "user", "id": "netdev1", "dnssearch": "example.org" } } <- { "return": {} } netdev\_del (Command) Remove a network backend. Arguments: "id: string" the name of the network backend to remove Returns: Nothing on success If "id" is not a valid network backend, DeviceNotFound Since: 0.14.0 Example: -> { "execute": "netdev\_del", "arguments": { "id": "netdev1" } } <- { "return": {} } NetLegacyNicOptions (Object) Create a new Network Interface Card. Members: "netdev: string" (optional) id of -netdev to connect to "macaddr: string" (optional) MAC address "model: string" (optional) device model (e1000, rtl8139, virtio etc.) "addr: string" (optional) PCI device address "vectors: int" (optional) number of MSI-x vectors, 0 to disable MSI-X

Since: 1.2

Use the user mode network stack which requires no administrator privilege to run. Members: "hostname: string" (optional) client hostname reported by the builtin DHCP server "restrict: boolean" (optional) isolate the guest from the host "ipv4: boolean" (optional) whether to support IPv4, default true for enabled (since 2.6) "ipv6: boolean" (optional) whether to support IPv6, default true for enabled (since 2.6) "ip: string" (optional) legacy parameter, use net= instead "net: string" (optional) IP network address that the guest will see, in the form addr[/netmask] The netmask is optional, and can be either in the form a.b.c.d or as a number of valid top-most bits. Default is 10.0.2.0/24. "host: string" (optional) guest-visible address of the host "tftp: string" (optional) root directory of the built-in TFTP server "bootfile: string" (optional) BOOTP filename, for use with tftp= "dhcpstart: string" (optional) the first of the 16 IPs the built-in DHCP server can assign "dns: string" (optional) guest-visible address of the virtual nameserver "dnssearch: array of String" (optional) list of DNS suffixes to search, passed as DHCP option to the guest "domainname: string" (optional) guest-visible domain name of the virtual nameserver (since 3.0) "ipv6-prefix: string" (optional) IPv6 network prefix (default is fec0::) (since 2.6). The network prefix is

given in the usual hexadecimal IPv6 address notation.

```
"ipv6-prefixlen: int" (optional)
  IPv6 network prefix length (default is 64) (since 2.6)
"ipv6-host: string" (optional)
  guest-visible IPv6 address of the host (since 2.6)
"ipv6-dns: string" (optional)
  guest-visible IPv6 address of the virtual nameserver (since 2.6)
"smb: string" (optional)
  root directory of the built-in SMB server
"smbserver: string" (optional)
  IP address of the built-in SMB server
"hostfwd: array of String" (optional)
  redirect incoming TCP or UDP host connections to guest endpoints
"guestfwd: array of String" (optional)
  forward guest TCP connections
"tftp-server-name: string" (optional)
  RFC2132 "TFTP server name" string (Since 3.1)
Since: 1.2
NetdevTapOptions (Object)
Used to configure a host TAP network interface backend.
Members:
"ifname: string" (optional)
  interface name
"fd: string" (optional)
  file descriptor of an already opened tap
"fds: string" (optional)
  multiple file descriptors of already opened multiqueue capable tap
"script: string" (optional)
  script to initialize the interface
"downscript: string" (optional)
  script to shut down the interface
"br: string" (optional)
  bridge name (since 2.8)
```

"helper: string" (optional)

```
command to execute to configure bridge
"sndbuf: int" (optional)
  send buffer limit. Understands [TGMKkb] suffixes.
"vnet_hdr: boolean" (optional)
  enable the IFF_VNET_HDR flag on the tap interface
"vhost: boolean" (optional)
  enable vhost-net network accelerator
"vhostfd: string" (optional)
  file descriptor of an already opened vhost net device
"vhostfds: string" (optional)
  file descriptors of multiple already opened vhost net devices
"vhostforce: boolean" (optional)
  vhost on for non-MSIX virtio guests
"queues: int" (optional)
  number of queues to be created for multiqueue capable tap
"poll-us: int" (optional)
  maximum number of microseconds that could be spent on busy polling for tap
  (since 2.7)
Since: 1.2
NetdevSocketOptions (Object)
Socket netdevs are used to establish a network connection to another QEMU virtual
machine via a TCP socket.
Members:
"fd: string" (optional)
  file descriptor of an already opened socket
"listen: string" (optional)
  port number, and optional hostname, to listen on
"connect: string" (optional)
  port number, and optional hostname, to connect to
"mcast: string" (optional)
  UDP multicast address and port number
"localaddr: string" (optional)
```

source address and port for multicast and udp packets

```
"udp: string" (optional)
  UDP unicast address and port number
Since: 1.2
NetdevL2TPv3Options (Object)
Configure an Ethernet over L2TPv3 tunnel.
Members:
"src: string"
  source address
"dst: string"
  destination address
"srcport: string" (optional)
  source port - mandatory for udp, optional for ip
"dstport: string" (optional)
  destination port - mandatory for udp, optional for ip
"ipv6: boolean" (optional)
  force the use of ipv6
"udp: boolean" (optional)
  use the udp version of l2tpv3 encapsulation
"cookie64: boolean" (optional)
  use 64 bit coookies
"counter: boolean" (optional)
  have sequence counter
"pincounter: boolean" (optional)
  pin sequence counter to zero - workaround for buggy implementations or networks
  with packet reorder
"txcookie: int" (optional)
  32 or 64 bit transmit cookie
"rxcookie: int" (optional)
  32 or 64 bit receive cookie
"txsession: int"
  32 bit transmit session
"rxsession: int" (optional)
```

32 bit receive session - if not specified set to the same value as transmit

```
"offset: int" (optional)
  additional offset - allows the insertion of additional application-specific
  data before the packet payload
Since: 2.1
NetdevVdeOptions (Object)
Connect to a vde switch running on the host.
Members:
"sock: string" (optional)
  socket path
"port: int" (optional)
  port number
"group: string" (optional)
  group owner of socket
"mode: int" (optional)
  permissions for socket
Since: 1.2
NetdevBridgeOptions (Object)
Connect a host TAP network interface to a host bridge device.
Members:
"br: string" (optional)
  bridge name
"helper: string" (optional)
  command to execute to configure bridge
Since: 1.2
NetdevHubPortOptions (Object)
Connect two or more net clients through a software hub.
Members:
"hubid: int"
  hub identifier number
"netdev: string" (optional)
  used to connect hub to a netdev instead of a device (since 2.12)
Since: 1.2
```

```
Connect a client to a netmap-enabled NIC or to a VALE switch port
Members:
"ifname: string"
  Either the name of an existing network interface supported by netmap, or the
  name of a VALE port (created on the fly). A VALE port name is in the form
  'valeXXX:YYY', where XXX and YYY are non-negative integers. XXX identifies a
  switch and YYY identifies a port of the switch. VALE ports having the same XXX
  are therefore connected to the same switch.
"devname: string" (optional)
  path of the netmap device (default: '/dev/netmap').
Since: 2.0
NetdevVhostUserOptions (Object)
Vhost-user network backend
Members:
"chardev: string"
  name of a unix socket chardev
"vhostforce: boolean" (optional)
  vhost on for non-MSIX virtio guests (default: false).
"queues: int" (optional)
  number of queues to be created for multiqueue vhost-user (default: 1) (Since
  2.5)
Since: 2.1
NetClientDriver (Enum)
Available netdev drivers.
Values:
"none"
  Not documented
"nic"
```

Not documented

Not documented

"user"

"tap"

Not documented Page 169/325

"I2tpv3" Not documented "socket" Not documented "vde" Not documented "bridge" Not documented "hubport" Not documented "netmap" Not documented "vhost-user" Not documented Since: 2.7 'dump': dropped in 2.12 Netdev (Object) Captures the configuration of a network device. Members: "id: string" identifier for monitor commands. "type: NetClientDriver" Specify the driver used for interpreting remaining arguments. The members of "NetLegacyNicOptions" when "type" is "nic" The members of "NetdevUserOptions" when "type" is "user" The members of "NetdevTapOptions" when "type" is "tap" The members of "NetdevL2TPv3Options" when "type" is "I2tpv3" The members of "NetdevSocketOptions" when "type" is "socket" The members of "NetdevVdeOptions" when "type" is "vde" The members of "NetdevBridgeOptions" when "type" is "bridge" The members of "NetdevHubPortOptions" when "type" is "hubport" The members of "NetdevNetmapOptions" when "type" is "netmap"

The members of "NetdevVhostUserOptions" when "type" is "vhost-user"

```
Since: 1.2
'I2tpv3' - since 2.1
NetLegacy (Object)
Captures the configuration of a network device; legacy.
Members:
"id: string" (optional)
  identifier for monitor commands
"name: string" (optional)
  identifier for monitor commands, ignored if "id" is present
"opts: NetLegacyOptions"
  device type specific properties (legacy)
Since: 1.2
'vlan': dropped in 3.0
NetLegacyOptionsType (Enum)

  Not documented
"netmap"
```

Not documented Page 171/325

```
"vhost-user"
  Not documented
Since: 1.2
NetLegacyOptions (Object)
Like Netdev, but for use only by the legacy command line options
Members:
"type: NetLegacyOptionsType"
  Not documented
The members of "NetLegacyNicOptions" when "type" is "nic"
The members of "NetdevUserOptions" when "type" is "user"
The members of "NetdevTapOptions" when "type" is "tap"
The members of "NetdevL2TPv3Options" when "type" is "I2tpv3"
The members of "NetdevSocketOptions" when "type" is "socket"
The members of "NetdevVdeOptions" when "type" is "vde"
The members of "NetdevBridgeOptions" when "type" is "bridge"
The members of "NetdevNetmapOptions" when "type" is "netmap"
The members of "NetdevVhostUserOptions" when "type" is "vhost-user"
Since: 1.2
NetFilterDirection (Enum)
Indicates whether a netfilter is attached to a netdev's transmit queue or receive
queue or both.
Values:
"all"
  the filter is attached both to the receive and the transmit queue of the netdev
  (default).
"rx"
  the filter is attached to the receive queue of the netdev, where it will
  receive packets sent to the netdev.
"tx"
  the filter is attached to the transmit queue of the netdev, where it will
  receive packets sent by the netdev.
```

Since: 2.5

RxState (Enum) Page 172/325

Packets receiving state Values: "normal" filter assigned packets according to the mac-table "none" don't receive any assigned packet "all" receive all assigned packets Since: 1.6 RxFilterInfo (Object) Rx-filter information for a NIC. Members: "name: string" net client name "promiscuous: boolean" whether promiscuous mode is enabled "multicast: RxState" multicast receive state "unicast: RxState" unicast receive state "vlan: RxState" vlan receive state (Since 2.0) "broadcast-allowed: boolean" whether to receive broadcast "multicast-overflow: boolean" multicast table is overflowed or not "unicast-overflow: boolean" unicast table is overflowed or not "main-mac: string" the main macaddr string "vlan-table: array of int" a list of active vlan id

"unicast-table: array of string"

```
a list of unicast macaddr string
"multicast-table: array of string"
  a list of multicast macaddr string
Since: 1.6
query-rx-filter (Command) Return rx-filter information for all NICs (or for the
given NIC).
Arguments:
"name: string" (optional)
  net client name
Returns: list of "RxFilterInfo" for all NICs (or for the given NIC). Returns an
error if the given "name" doesn't exist, or given NIC doesn't support rx-filter
querying, or given net client isn't a NIC.
Since: 1.6
Example:
     -> { "execute": "query-rx-filter", "arguments": { "name": "vnet0" } }
     <- { "return": [
          {
             "promiscuous": true,
             "name": "vnet0",
             "main-mac": "52:54:00:12:34:56",
             "unicast": "normal",
             "vlan": "normal",
             "vlan-table": [
               4,
               0
             ],
             "unicast-table": [
             ],
             "multicast": "normal",
             "multicast-overflow": false,
             "unicast-overflow": false,
             "multicast-table": [
               "01:00:5e:00:00:01",
```

```
"33:33:00:00:00:01",
              "33:33:ff:12:34:56"
            ],
            "broadcast-allowed": false
         }
        ]
      }
NIC_RX_FILTER_CHANGED (Event) Emitted once until the 'query-rx-filter' command is
executed, the first event will always be emitted
Arguments:
"name: string" (optional)
  net client name
"path: string"
  device path
Since: 1.6
Example:
    <- { "event": "NIC_RX_FILTER_CHANGED",
        "data": { "name": "vnet0",
              "path": "/machine/peripheral/vnet0/virtio-backend" },
       "timestamp": { "seconds": 1368697518, "microseconds": 326866 } }
      }
AnnounceParameters (Object)
Parameters for self-announce timers
Members:
"initial: int"
  Initial delay (in ms) before sending the first GARP/RARP announcement
"max: int"
  Maximum delay (in ms) between GARP/RARP announcement packets
"rounds: int"
  Number of self-announcement attempts
"step: int"
  Delay increase (in ms) after each self-announcement attempt
"interfaces: array of string" (optional)
```

```
An optional list of interface names, which restricts the announcement to the
    listed interfaces. (Since 4.1)
  "id: string" (optional)
    A name to be used to identify an instance of announce-timers and to allow it to
    modified later. Not for use as part of the migration parameters. (Since 4.1)
  Since: 4.0
  announce-self (Command) Trigger generation of broadcast RARP frames to update
  network switches. This can be useful when network bonds fail-over the active
  slave.
  Arguments: the members of "AnnounceParameters"
  Example:
       -> { "execute": "announce-self",
          "arguments": {
            "initial": 50, "max": 550, "rounds": 10, "step": 50,
            "interfaces": ["vn2", "vn3"], "id": "bob" } }
       <- { "return": {} }
  Since: 4.0
  FAILOVER NEGOTIATED (Event) Emitted when VIRTIO NET F STANDBY was enabled during
  feature negotiation. Failover primary devices which were hidden (not hotplugged
  when requested) before will now be hotplugged by the virtio-net standby device.
  device-id: QEMU device id of the unplugged device
  Arguments:
  "device-id: string"
    Not documented
  Since: 4.2
  Example:
       <- { "event": "FAILOVER_NEGOTIATED",
          "data": "net1" }
RDMA device
  RDMA_GID_STATUS_CHANGED (Event) Emitted when guest driver adds/deletes GID to/from
  device
  Arguments:
```

"netdev: string"

Page 176/325

```
RoCE Network Device name
  "gid-status: boolean"
    Add or delete indication
  "subnet-prefix: int"
    Subnet Prefix
  "interface-id: int"
    Not documented
  "interface-id": Interface ID
  Since: 4.0
  Example:
       <- {"timestamp": {"seconds": 1541579657, "microseconds": 986760},
         "event": "RDMA_GID_STATUS_CHANGED",
         "data":
            {"netdev": "bridge0",
            "interface-id": 15880512517475447892,
            "gid-status": true,
            "subnet-prefix": 33022}}
Rocker switch device
  RockerSwitch (Object)
  Rocker switch information.
  Members:
  "name: string"
    switch name
  "id: int"
    switch ID
  "ports: int"
    number of front-panel ports
  Since: 2.4
  query-rocker (Command) Return rocker switch information.
  Arguments:
  "name: string"
    Not documented
```

Returns: "Rocker" information

```
Example:
     -> { "execute": "query-rocker", "arguments": { "name": "sw1" } }
     <- { "return": {"name": "sw1", "ports": 2, "id": 1327446905938}}
RockerPortDuplex (Enum)
An eumeration of port duplex states.
Values:
"half"
  half duplex
"full"
  full duplex
Since: 2.4
RockerPortAutoneg (Enum)
An eumeration of port autoneg states.
Values:
"off"
  autoneg is off
"on"
  autoneg is on
Since: 2.4
RockerPort (Object)
Rocker switch port information.
Members:
"name: string"
  port name
"enabled: boolean"
  port is enabled for I/O
"link-up: boolean"
  physical link is UP on port
"speed: int"
  port link speed in Mbps
"duplex: RockerPortDuplex"
```

Since: 2.4

port link duplex

Page 178/325

```
"autoneg: RockerPortAutoneg"
  port link autoneg
Since: 2.4
query-rocker-ports (Command) Return rocker switch port information.
Arguments:
"name: string"
  Not documented
Returns: a list of "RockerPort" information
Since: 2.4
Example:
     -> { "execute": "query-rocker-ports", "arguments": { "name": "sw1" } }
     <- { "return": [ {"duplex": "full", "enabled": true, "name": "sw1.1",
                 "autoneg": "off", "link-up": true, "speed": 10000},
                {"duplex": "full", "enabled": true, "name": "sw1.2",
                 "autoneg": "off", "link-up": true, "speed": 10000}
       ]}
RockerOfDpaFlowKey (Object)
Rocker switch OF-DPA flow key
Members:
"priority: int"
  key priority, 0 being lowest priority
"tbl-id: int"
  flow table ID
"in-pport: int" (optional)
  physical input port
"tunnel-id: int" (optional)
  tunnel ID
"vlan-id: int" (optional)
  VLAN ID
"eth-type: int" (optional)
  Ethernet header type
"eth-src: string" (optional)
```

"eth-dst: string" (optional) Ethernet header destination MAC address "ip-proto: int" (optional) IP Header protocol field "ip-tos: int" (optional) IP header TOS field "ip-dst: string" (optional) IP header destination address Note: optional members may or may not appear in the flow key depending if they're relevant to the flow key. Since: 2.4 RockerOfDpaFlowMask (Object) Rocker switch OF-DPA flow mask Members: "in-pport: int" (optional) physical input port "tunnel-id: int" (optional) tunnel ID "vlan-id: int" (optional) **VLAN ID** "eth-src: string" (optional) Ethernet header source MAC address "eth-dst: string" (optional) Ethernet header destination MAC address "ip-proto: int" (optional) IP Header protocol field "ip-tos: int" (optional) IP header TOS field Note: optional members may or may not appear in the flow mask depending if they're relevant to the flow mask.

Since: 2.4

RockerOfDpaFlowAction (Object)

```
Members:
"goto-tbl: int" (optional)
  next table ID
"group-id: int" (optional)
  group ID
"tunnel-lport: int" (optional)
  tunnel logical port ID
"vlan-id: int" (optional)
  VLAN ID
"new-vlan-id: int" (optional)
  new VLAN ID
"out-pport: int" (optional)
  physical output port
Note: optional members may or may not appear in the flow action depending if
they're relevant to the flow action.
Since: 2.4
RockerOfDpaFlow (Object)
Rocker switch OF-DPA flow
Members:
"cookie: int"
  flow unique cookie ID
"hits: int"
  count of matches (hits) on flow
"key: RockerOfDpaFlowKey"
  flow key
"mask: RockerOfDpaFlowMask"
  flow mask
"action: RockerOfDpaFlowAction"
  flow action
Since: 2.4
query-rocker-of-dpa-flows (Command) Return rocker OF-DPA flow information.
Arguments:
```

"name: string"

Page 181/325

```
switch name
"tbl-id: int" (optional)
  flow table ID. If tbl-id is not specified, returns flow information for all
  tables.
Returns: rocker OF-DPA flow information
Since: 2.4
Example:
     -> { "execute": "query-rocker-of-dpa-flows",
        "arguments": { "name": "sw1" } }
     <- { "return": [ {"key": {"in-pport": 0, "priority": 1, "tbl-id": 0},
                 "hits": 138,
                 "cookie": 0,
                 "action": {"goto-tbl": 10},
                 "mask": {"in-pport": 4294901760}
                },
                {...more...},
      ]}
RockerOfDpaGroup (Object)
Rocker switch OF-DPA group
Members:
"id: int"
  group unique ID
"type: int"
  group type
"vlan-id: int" (optional)
  VLAN ID
"pport: int" (optional)
  physical port number
"index: int" (optional)
  group index, unique with group type
"out-pport: int" (optional)
  output physical port number
"group-id: int" (optional)
```

```
next group ID
"set-vlan-id: int" (optional)
  VLAN ID to set
"pop-vlan: int" (optional)
  pop VLAN headr from packet
"group-ids: array of int" (optional)
  list of next group IDs
"set-eth-src: string" (optional)
  set source MAC address in Ethernet header
"set-eth-dst: string" (optional)
  set destination MAC address in Ethernet header
"ttl-check: int" (optional)
  perform TTL check
Note: optional members may or may not appear in the group depending if they're
relevant to the group type.
Since: 2.4
query-rocker-of-dpa-groups (Command) Return rocker OF-DPA group information.
Arguments:
"name: string"
  switch name
"type: int" (optional)
  group type. If type is not specified, returns group information for all group
  types.
Returns: rocker OF-DPA group information
Since: 2.4
Example:
     -> { "execute": "query-rocker-of-dpa-groups",
        "arguments": { "name": "sw1" } }
     <- { "return": [ {"type": 0, "out-pport": 2,
                "pport": 2, "vlan-id": 3841,

                {"type": 0, "out-pport": 0,
```

"pport": 0, "vlan-id": 3841,

```
"pop-vlan": 1, "id": 251723776},
                  {"type": 0, "out-pport": 1,
                  "pport": 1, "vlan-id": 3840,
                  "pop-vlan": 1, "id": 251658241},
                  {"type": 0, "out-pport": 0,
                  "pport": 0, "vlan-id": 3840,
                  "pop-vlan": 1, "id": 251658240}
         ]}
TPM (trusted platform module) devices
  TpmModel (Enum)
  An enumeration of TPM models
  Values:
  "tpm-tis"
    TPM TIS model
  "tpm-crb"
    TPM CRB model (since 2.12)
  Since: 1.5
  query-tpm-models (Command) Return a list of supported TPM models
  Returns: a list of TpmModel
  Since: 1.5
  Example:
       -> { "execute": "query-tpm-models" }
       <- { "return": [ "tpm-tis", "tpm-crb" ] }
  TpmType (Enum)
  An enumeration of TPM types
  Values:
  "passthrough"
    TPM passthrough type
  "emulator"
    Software Emulator TPM type Since: 2.11
  Since: 1.5
  query-tpm-types (Command) Return a list of supported TPM types
```

Returns: a list of TpmType

Page 184/325

```
Since: 1.5
Example:
    -> { "execute": "query-tpm-types" }
     <- { "return": [ "passthrough", "emulator" ] }
TPMPassthroughOptions (Object)
Information about the TPM passthrough type
Members:
"path: string" (optional)
  string describing the path used for accessing the TPM device
"cancel-path: string" (optional)
  string showing the TPM's sysfs cancel file for cancellation of TPM commands
  while they are executing
Since: 1.5
TPMEmulatorOptions (Object)
Information about the TPM emulator type
Members:
"chardev: string"
  Name of a unix socket chardev
Since: 2.11
TpmTypeOptions (Object)
A union referencing different TPM backend types' configuration options
Members:
"type"
  'passthrough' The configuration options for the TPM passthrough type 'emulator'
  The configuration options for TPM emulator backend type
"data: TPMPassthroughOptions" when "type" is "passthrough"
"data: TPMEmulatorOptions" when "type" is "emulator"
Since: 1.5
TPMInfo (Object)
Information about the TPM
Members:
"id: string"
```

The Id of the TPM Page 185/325

```
"model: TpmModel"
    The TPM frontend model
  "options: TpmTypeOptions"
    The TPM (backend) type configuration options
  Since: 1.5
  query-tpm (Command) Return information about the TPM device
  Returns: "TPMInfo" on success
  Since: 1.5
  Example:
       -> { "execute": "query-tpm" }
       <- { "return":
          ſ
           { "model": "tpm-tis",
             "options":
              { "type": "passthrough",
               "data":
                { "cancel-path": "/sys/class/misc/tpm0/device/cancel",
                 "path": "/dev/tpm0"
                }
             },
            "id": "tpm0"
           }
          ]
         }
Remote desktop
  set_password (Command) Sets the password of a remote display session.
  Arguments:
  "protocol: string"
    `vnc' to modify the VNC server password `spice' to modify the Spice server
    password
  "password: string"
    the new password
  "connected: string" (optional)
```

how to handle existing clients when changing the password. If nothing is specified, defaults to `keep' `fail' to fail the command if clients are connected `disconnect' to disconnect existing clients `keep' to maintain existing clients

Returns: Nothing on success If Spice is not enabled, DeviceNotFound

Since: 0.14.0

Example:

expire\_password (Command) Expire the password of a remote display server.

Arguments:

"protocol: string"

the name of the remote display protocol `vnc' or `spice'

"time: string"

when to expire the password. `now' to expire the password immediately `never' to cancel password expiration `+INT' where INT is the number of seconds from now (integer) `INT' where INT is the absolute time in seconds

Returns: Nothing on success If "protocol" is `spice' and Spice is not active,

DeviceNotFound

Since: 0.14.0

Notes: Time is relative to the server and currently there is no way to coordinate server time with client time. It is not recommended to use the absolute time version of the "time" parameter unless you're sure you are on the same machine as the QEMU instance.

Example:

screendump (Command) Write a PPM of the VGA screen to a file.

Arguments:

"filename: string"

the path of a new PPM file to store the image

```
"device: string" (optional)
  ID of the display device that should be dumped. If this parameter is missing,
  the primary display will be used. (Since 2.12)
"head: int" (optional)
  head to use in case the device supports multiple heads. If this parameter is
  missing, head #0 will be used. Also note that the head can only be specified in
  conjunction with the device ID. (Since 2.12)
Returns: Nothing on success
Since: 0.14.0
Example:
    -> { "execute": "screendump",
        "arguments": { "filename": "/tmp/image" } }
     <- { "return": {} }
Spice
SpiceBasicInfo (Object)
The basic information for SPICE network connection
Members:
"host: string"
  IP address
"port: string"
  port number
"family: NetworkAddressFamily"
  address family
Since: 2.1
If: "defined(CONFIG_SPICE)"
SpiceServerInfo (Object)
Information about a SPICE server
Members:
"auth: string" (optional)
  authentication method
The members of "SpiceBasicInfo"
Since: 2.1
```

If: "defined(CONFIG\_SPICE)"

SpiceChannel (Object) Information about a SPICE client channel. Members: "connection-id: int" SPICE connection id number. All channels with the same id belong to the same SPICE session. "channel-type: int" SPICE channel type number. "1" is the main control channel, filter for this one if you want to track spice sessions only "channel-id: int" SPICE channel ID number. Usually "0", might be different when multiple channels of the same type exist, such as multiple display channels in a multihead setup "tls: boolean" true if the channel is encrypted, false otherwise. The members of "SpiceBasicInfo" Since: 0.14.0 If: "defined(CONFIG SPICE)" SpiceQueryMouseMode (Enum) An enumeration of Spice mouse states. Values: "client" Mouse cursor position is determined by the client. "server" Mouse cursor position is determined by the server. "unknown" No information is available about mouse mode used by the spice server. Note: spice/enums.h has a SpiceMouseMode already, hence the name. Since: 1.1 If: "defined(CONFIG\_SPICE)" SpiceInfo (Object) Information about the SPICE session.

Members:

Page 189/325

```
"enabled: boolean"
  true if the SPICE server is enabled, false otherwise
"migrated: boolean"
  true if the last guest migration completed and spice migration had completed as
  well. false otherwise. (since 1.4)
"host: string" (optional)
  The hostname the SPICE server is bound to. This depends on the name resolution
  on the host and may be an IP address.
"port: int" (optional)
  The SPICE server's port number.
"compiled-version: string" (optional)
  SPICE server version.
"tls-port: int" (optional)
  The SPICE server's TLS port number.
"auth: string" (optional)
  the current authentication type used by the server 'none' if no authentication
  is being used 'spice' uses SASL or direct TLS authentication, depending on
  command line options
"mouse-mode: SpiceQueryMouseMode"
  The mode in which the mouse cursor is displayed currently. Can be determined by
  the client or the server, or unknown if spice server doesn't provide this
  information. (since: 1.1)
"channels: array of SpiceChannel" (optional)
  a list of "SpiceChannel" for each active spice channel
Since: 0.14.0
If: "defined(CONFIG SPICE)"
query-spice (Command) Returns information about the current SPICE server
Returns: "SpiceInfo"
Since: 0.14.0
Example:
    -> { "execute": "query-spice" }
     <- { "return": {
          "enabled": true,
```

```
"port": 5920,
           "tls-port": 5921,
           "host": "0.0.0.0",
           "channels": [
             {
              "port": "54924",
              "family": "ipv4",
              "channel-type": 1,
              "connection-id": 1804289383,
              "host": "127.0.0.1",
              "channel-id": 0,
              "tls": true
            },
              "port": "36710",
              "family": "ipv4",
              "channel-type": 4,
               "connection-id": 1804289383,
              "host": "127.0.0.1",
              "channel-id": 0,
              "tls": false
            },
            [ ... more channels follow ... ]
          ]
If: "defined(CONFIG_SPICE)"
SPICE_CONNECTED (Event) Emitted when a SPICE client establishes a connection
Arguments:
"server: SpiceBasicInfo"
  server information
"client: SpiceBasicInfo"
```

"auth": "spice",

"server: SpiceBasicInfo"

server information

"client: SpiceBasicInfo"

Page 192/325

```
Since: 0.14.0
Example:
    <- { "timestamp": {"seconds": 1290688046, "microseconds": 388707},
       "event": "SPICE_DISCONNECTED",
        "data": {

         "client": {"port": "52873", "family": "ipv4", "host": "127.0.0.1"}
      }}
If: "defined(CONFIG SPICE)"
SPICE_MIGRATE_COMPLETED (Event) Emitted when SPICE migration has completed
Since: 1.3
Example:
    <- { "timestamp": {"seconds": 1290688046, "microseconds": 417172},
        "event": "SPICE_MIGRATE_COMPLETED" }
If: "defined(CONFIG_SPICE)"
VNC
VncBasicInfo (Object)
The basic information for vnc network connection
Members:
"host: string"
  IP address
"service: string"
  The service name of the vnc port. This may depend on the host system's service
  database so symbolic names should not be relied on.
"family: NetworkAddressFamily"
  address family
"websocket: boolean"
  true in case the socket is a websocket (since 2.3).
Since: 2.1
If: "defined(CONFIG_VNC)"
```

VncServerInfo (Object)

Members: "auth: string" (optional) authentication method used for the plain (non-websocket) VNC server The members of "VncBasicInfo" Since: 2.1 If: "defined(CONFIG\_VNC)" VncClientInfo (Object) Information about a connected VNC client. Members: "x509\_dname: string" (optional) If x509 authentication is in use, the Distinguished Name of the client. "sasl\_username: string" (optional) If SASL authentication is in use, the SASL username used for authentication. The members of "VncBasicInfo" Since: 0.14.0 If: "defined(CONFIG\_VNC)" VncInfo (Object) Information about the VNC session. Members: "enabled: boolean" true if the VNC server is enabled, false otherwise "host: string" (optional) The hostname the VNC server is bound to. This depends on the name resolution on the host and may be an IP address. "family: NetworkAddressFamily" (optional) 'ipv6' if the host is listening for IPv6 connections 'ipv4' if the host is listening for IPv4 connections 'unix' if the host is listening on a unix domain socket 'unknown' otherwise "service: string" (optional) The service name of the server's port. This may depends on the host system's service database so symbolic names should not be relied on.

the current authentication type used by the server 'none' if no authentication

"auth: string" (optional)

is being used 'vnc' if VNC authentication is being used 'vencrypt+plain' if VEncrypt is used with plain text authentication 'vencrypt+tls+none' if VEncrypt is used with TLS and no authentication 'vencrypt+tls+vnc' if VEncrypt is used with TLS and VNC authentication 'vencrypt+tls+plain' if VEncrypt is used with TLS and plain text auth 'vencrypt+x509+none' if VEncrypt is used with x509 and no auth 'vencrypt+x509+vnc' if VEncrypt is used with x509 and VNC auth 'vencrypt+x509+plain' if VEncrypt is used with x509 and plain text auth 'vencrypt+tls+sasl' if VEncrypt is used with TLS and SASL auth 'vencrypt+x509+sasl' if VEncrypt is used with x509 and SASL auth

"clients: array of VncClientInfo" (optional)

a list of "VncClientInfo" of all currently connected clients

Since: 0.14.0

If: "defined(CONFIG\_VNC)"

VncPrimaryAuth (Enum)

vnc primary authentication method.

Values:

"none"

Not documented

"vnc"

Not documented

"ra2"

Not documented

"ra2ne"

Not documented

"tight"

Not documented

"ultra"

Not documented

"tls"

"vencrypt"

Not documented

"sasl" Page 195/325

Since: 2.3 If: "defined(CONFIG\_VNC)" VncVencryptSubAuth (Enum) vnc sub authentication method with vencrypt. Values: "plain" Not documented "tls-none" Not documented "x509-none" Not documented "tls-vnc" Not documented "x509-vnc" Not documented "tls-plain" Not documented "x509-plain" Not documented "tls-sasl" Not documented "x509-sasl" Not documented Since: 2.3 If: "defined(CONFIG\_VNC)" VncServerInfo2 (Object) The network connection information for server Members: "auth: VncPrimaryAuth" The current authentication type used by the servers

Not documented

"vencrypt: VncVencryptSubAuth" (optional)

The vencrypt sub authentication type used by the servers, only specified in

```
case auth == vencrypt.
The members of "VncBasicInfo"
Since: 2.9
If: "defined(CONFIG_VNC)"
VncInfo2 (Object)
Information about a vnc server
Members:
"id: string"
  vnc server name.
"server: array of VncServerInfo2"
  A list of "VncBasincInfo" describing all listening sockets. The list can be
  empty (in case the vnc server is disabled). It also may have multiple entries:
  normal + websocket, possibly also ipv4 + ipv6 in the future.
"clients: array of VncClientInfo"
  A list of "VncClientInfo" of all currently connected clients. The list can be
  empty, for obvious reasons.
"auth: VncPrimaryAuth"
  The current authentication type used by the non-websockets servers
"vencrypt: VncVencryptSubAuth" (optional)
  The vencrypt authentication type used by the servers, only specified in case
  auth == vencrypt.
"display: string" (optional)
  The display device the vnc server is linked to.
Since: 2.3
If: "defined(CONFIG_VNC)"
query-vnc (Command) Returns information about the current VNC server
Returns: "VncInfo"
Since: 0.14.0
Example:
    -> { "execute": "query-vnc" }
     <- { "return": {
          "enabled":true,
```

"host":"0.0.0.0",

```
"service": "50402",
          "auth":"vnc",
          "family":"ipv4",
          "clients":[
            {
              "host":"127.0.0.1",
              "service": "50401",
              "family":"ipv4"
            }
          ]
        }
      }
If: "defined(CONFIG_VNC)"
query-vnc-servers (Command) Returns a list of vnc servers. The list can be empty.
Returns: a list of "VncInfo2"
Since: 2.3
If: "defined(CONFIG_VNC)"
change-vnc-password (Command) Change the VNC server password.
Arguments:
"password: string"
  the new password to use with VNC authentication
Since: 1.1
Notes: An empty password in this command will set the password to the empty string.
Existing clients are unaffected by executing this command.
If: "defined(CONFIG_VNC)"
VNC_CONNECTED (Event) Emitted when a VNC client establishes a connection
Arguments:
"server: VncServerInfo"
  server information
"client: VncBasicInfo"
  client information
Note: This event is emitted before any authentication takes place, thus the
```

Page 198/325

```
Example:
     <- { "event": "VNC_CONNECTED",
        "data": {
            "server": { "auth": "sasl", "family": "ipv4",
                   "service": "5901", "host": "0.0.0.0" },
            "client": { "family": "ipv4", "service": "58425",
                   "host": "127.0.0.1" } },
        "timestamp": { "seconds": 1262976601, "microseconds": 975795 } }
If: "defined(CONFIG_VNC)"
VNC_INITIALIZED (Event) Emitted after authentication takes place (if any) and the
VNC session is made active
Arguments:
"server: VncServerInfo"
  server information
"client: VncClientInfo"
  client information
Since: 0.13.0
Example:
     <- { "event": "VNC_INITIALIZED",
         "data": {
            "server": { "auth": "sasl", "family": "ipv4",
                   "service": "5901", "host": "0.0.0.0"},
            "client": { "family": "ipv4", "service": "46089",
                   "host": "127.0.0.1", "sasl_username": "luiz" } },
         "timestamp": { "seconds": 1263475302, "microseconds": 150772 } }
If: "defined(CONFIG_VNC)"
VNC_DISCONNECTED (Event) Emitted when the connection is closed
Arguments:
"server: VncServerInfo"
  server information
"client: VncClientInfo"
```

Since: 0.13.0

client information

```
Example:
       <- { "event": "VNC_DISCONNECTED",
          "data": {
              "server": { "auth": "sasl", "family": "ipv4",
                      "service": "5901", "host": "0.0.0.0" },
              "client": { "family": "ipv4", "service": "58425",
                      "host": "127.0.0.1", "sasl_username": "luiz" } },
          "timestamp": { "seconds": 1262976601, "microseconds": 975795 } }
  If: "defined(CONFIG_VNC)"
Input
  MouseInfo (Object)
  Information about a mouse device.
  Members:
  "name: string"
    the name of the mouse device
  "index: int"
    the index of the mouse device
  "current: boolean"
    true if this device is currently receiving mouse events
  "absolute: boolean"
    true if this device supports absolute coordinates as input
  Since: 0.14.0
  query-mice (Command) Returns information about each active mouse device
  Returns: a list of "MouseInfo" for each device
  Since: 0.14.0
  Example:
       -> { "execute": "query-mice" }
       <- { "return": [
               "name": "QEMU Microsoft Mouse",
               "index":0,

'sysrq' was mistakenly added to hack around the fact that the ps2 driver was not generating correct scancodes sequences when 'alt+print' was pressed. This flaw is now fixed and the 'sysrq' key serves no further purpose. Any further use of 'sysrq' will be transparently changed to 'print', so they are effectively synonyms.

Since: 1.3.0

KeyValue (Object)

Represents a keyboard key.

Members:

"type"

One of "number", "qcode"

"data: int" when "type" is "number"

"data: QKeyCode" when "type" is "qcode"

Since: 1.3.0

send-key (Command) Send keys to guest.

Arguments:

"keys: array of KeyValue"

An array of "KeyValue" elements. All "KeyValues" in this array are simultaneously sent to the guest. A "KeyValue".number value is sent directly to the guest, while "KeyValue".qcode must be a valid "QKeyCode" value

"hold-time: int" (optional)

time to delay key up events, milliseconds. Defaults to 100

Returns: Nothing on success If key is unknown or redundant, InvalidParameter

Since: 1.3.0 Page 209/325

```
Example:
     -> { "execute": "send-key",
        "arguments": { "keys": [ { "type": "qcode", "data": "ctrl" },
                        { "type": "qcode", "data": "alt" },
                        { "type": "qcode", "data": "delete" } ] } }
     <- { "return": {} }
InputButton (Enum)
Button of a pointer input device (mouse, tablet).
Values:
"side"
  front side button of a 5-button mouse (since 2.9)
"extra"
  rear side button of a 5-button mouse (since 2.9)
"left"
  Not documented
"middle"
  Not documented
"right"
  Not documented

"wheel-down"
  Not documented
Since: 2.0
InputAxis (Enum)
Position axis of a pointer input device (mouse, tablet).
Values:
"x" Not documented
"y" Not documented
Since: 2.0
InputKeyEvent (Object)
```

Keyboard input event.

Members: Page 210/325

"key: KeyValue" Which key this event is for. "down: boolean" True for key-down and false for key-up events. Since: 2.0 InputBtnEvent (Object) Pointer button input event. Members: "button: InputButton" Which button this event is for. "down: boolean" True for key-down and false for key-up events. Since: 2.0 InputMoveEvent (Object) Pointer motion input event. Members: "axis: InputAxis" Which axis is referenced by "value". "value: int" Pointer position. For absolute coordinates the valid range is 0 -> 0x7ffff Since: 2.0 InputEvent (Object) Input event union. Members: "type" the input type, one of: - 'key': Input event of Keyboard - 'btn': Input event of pointer buttons - 'rel': Input event of relative pointer motion - 'abs': Input event of absolute pointer motion "data: InputKeyEvent" when "type" is "key" "data: InputBtnEvent" when "type" is "btn"

"data: InputMoveEvent" when "type" is "rel"

"data: InputMoveEvent" when "type" is "abs"

Since: 2.0

input-send-event (Command) Send input event(s) to guest.

Arguments:

"device: string" (optional)

display device to send event(s) to.

"head: int" (optional)

head to send event(s) to, in case the display device supports multiple scanouts.

"events: array of InputEvent"

List of InputEvent union.

Returns: Nothing on success.

The "device" and "head" parameters can be used to send the input event to specific input devices in case (a) multiple input devices of the same kind are added to the virtual machine and (b) you have configured input routing (see docs/multiseat.txt) for those input devices. The parameters work exactly like the device and head properties of input devices. If "device" is missing, only devices that have no input routing config are admissible. If "device" is specified, both input devices with and without input routing config are admissible, but devices with input routing config take precedence.

Since: 2.6

Note: The consoles are visible in the qom tree, under /backend/console[\$index]. They have a device link and head property, so it is possible to map which console belongs to which device and display.

## Example:

1. Press left mouse button.

```
"events": [ { "type": "btn",
                  "data" : { "down": false, "button": "left" } } ] } }
     <- { "return": {} }
     2. Press ctrl-alt-del.
     -> { "execute": "input-send-event",
        "arguments": { "events": [
          { "type": "key", "data" : { "down": true,
            "key": {"type": "qcode", "data": "ctrl" } } },
          { "type": "key", "data" : { "down": true,
            "key": {"type": "qcode", "data": "alt" } },
          { "type": "key", "data" : { "down": true,
            "key": {"type": "qcode", "data": "delete" } } } ] }
     <- { "return": {} }
     3. Move mouse pointer to absolute coordinates (20000, 400).
     -> { "execute": "input-send-event",
      "arguments": { "events": [
               { "type": "abs", "data" : { "axis": "x", "value" : 20000 } },
               { "type": "abs", "data" : { "axis": "y", "value" : 400 } } ] } }
     <- { "return": {} }
GrabToggleKeys (Enum)
Keys to toggle input-linux between host and guest.
Values:
"ctrl-ctrl"
  Not documented
"alt-alt"
  Not documented
"shift-shift"
  Not documented
"meta-meta"
  Not documented
"scrolllock"
  Not documented
```

"ctrl-scrolllock"

Page 213/325

Not documented Since: 4.0 DisplayGTK (Object) GTK display options. Members: "grab-on-hover: boolean" (optional) Grab keyboard input on mouse hover. "zoom-to-fit: boolean" (optional) Zoom guest display to fit into the host window. When turned off the host window will be resized instead. In case the display device can notify the guest on window resizes (virtio-gpu) this will default to "on", assuming the guest will resize the display to match the window size then. Otherwise it defaults to "off". Since 3.1 Since: 2.12 DisplayEGLHeadless (Object) EGL headless display options. Members: "rendernode: string" (optional) Which DRM render node should be used. Default is the first available node on the host. Since: 3.1 DisplayGLMode (Enum) Display OpenGL mode. Values: "off" Disable OpenGL (default). "on" Use OpenGL, pick context type automatically. Would better be named 'auto' but is called 'on' for backward compatibility with bool type. "core" Use OpenGL with Core (desktop) Context. "es"

Use OpenGL with ES (embedded systems) Context.

Since: 3.0 DisplayCurses (Object) Curses display options. Members: "charset: string" (optional) Font charset used by guest (default: CP437). Since: 4.0 DisplayType (Enum) Display (user interface) type. Values: "default" The default user interface, selecting from the first available of gtk, sdl, cocoa, and vnc. "none" No user interface or video output display. The guest will still see an emulated graphics card, but its output will not be displayed to the QEMU user. "gtk" The GTK user interface. "sdl" The SDL user interface. "egl-headless" No user interface, offload GL operations to a local DRI device. Graphical display need to be paired with VNC or Spice. (Since 3.1) "curses" Display video output via curses. For graphics device models which support a text mode, QEMU can display this output using a curses/ncurses interface. Nothing is displayed when the graphics device is in graphical mode or if the graphics device does not support a text mode. Generally only the VGA device models support text mode. "cocoa" The Cocoa user interface. "spice-app"

```
it. The server will redirect the serial console and QEMU monitors. (Since 4.0)
Since: 2.12
DisplayOptions (Object)
Display (user interface) options.
Members:
"type: DisplayType"
  Which DisplayType qemu should use.
"full-screen: boolean" (optional)
  Start user interface in fullscreen mode (default: off).
"window-close: boolean" (optional)
  Allow to quit gemu with window close button (default: on).
"gl: DisplayGLMode" (optional)
  Enable OpenGL support (default: off).
The members of "DisplayGTK" when "type" is "gtk"
The members of "DisplayCurses" when "type" is "curses"
The members of "DisplayEGLHeadless" when "type" is "egl-headless"
Since: 2.12
query-display-options (Command) Returns information about display configuration
Returns: "DisplayOptions"
Since: 3.1
QAuthZListPolicy (Enum)
The authorization policy result
Values:
"deny"
  deny access
"allow"
  allow access
Since: 4.0
QAuthZListFormat (Enum)
The authorization policy match format
Values:
"exact"
```

an exact string match Page 216/325

```
"glob"
    string with ? and * shell wildcard support
  Since: 4.0
  QAuthZListRule (Object)
  A single authorization rule.
  Members:
  "match: string"
    a string or glob to match against a user identity
  "policy: QAuthZListPolicy"
    the result to return if "match" evaluates to true
  "format: QAuthZListFormat" (optional)
    the format of the "match" rule (default 'exact')
  Since: 4.0
  QAuthZListRuleListHack (Object)
  Not exposed via QMP; hack to generate QAuthZListRuleList for use internally by the
  code.
  Members:
  "unused: array of QAuthZListRule"
    Not documented
  Since: 4.0
Migration
  MigrationStats (Object)
  Detailed migration status.
  Members:
  "transferred: int"
    amount of bytes already transferred to the target VM
  "remaining: int"
    amount of bytes remaining to be transferred to the target VM
  "total: int"
    total amount of bytes involved in the migration process
  "duplicate: int"
    number of duplicate (zero) pages (since 1.2)
```

Page 217/325

"skipped: int"

```
number of skipped zero pages (since 1.5)
"normal: int"
  number of normal pages (since 1.2)
"normal-bytes: int"
  number of normal bytes sent (since 1.2)
"dirty-pages-rate: int"
  number of pages dirtied by second by the guest (since 1.3)
"mbps: number"
  throughput in megabits/sec. (since 1.6)
"dirty-sync-count: int"
  number of times that dirty ram was synchronized (since 2.1)
"postcopy-requests: int"
  The number of page requests received from the destination (since 2.7)
"page-size: int"
  The number of bytes per page for the various page-based statistics (since 2.10)
"multifd-bytes: int"
  The number of bytes sent through multifd (since 3.0)
"pages-per-second: int"
  the number of memory pages transferred per second (Since 4.0)
Since: 0.14.0
XBZRLECacheStats (Object)
Detailed XBZRLE migration cache statistics
Members:
"cache-size: int"
  XBZRLE cache size
"bytes: int"
  amount of bytes already transferred to the target VM
"pages: int"
  amount of pages transferred to the target VM
"cache-miss: int"
  number of cache miss
"cache-miss-rate: number"
```

rate of cache miss (since 2.1)

```
"overflow: int"
  number of overflows
Since: 1.2
CompressionStats (Object)
Detailed migration compression statistics
Members:
"pages: int"
  amount of pages compressed and transferred to the target VM
"busy: int"
  count of times that no free thread was available to compress data
"busy-rate: number"
  rate of thread busy
"compressed-size: int"
  amount of bytes after compression
"compression-rate: number"
  rate of compressed size
Since: 3.1
MigrationStatus (Enum)
An enumeration of migration status.
Values:
"none"
  no migration has ever happened.
"setup"
  migration process has been initiated.
"cancelling"
  in the process of cancelling migration.
"cancelled"
  cancelling migration is finished.
"active"
  in the process of doing migration.
"postcopy-active"
  like active, but now in postcopy mode. (since 2.5)
                                                                                                          Page 219/325
```

"postcopy-paused"

```
during postcopy but paused. (since 3.0)
"postcopy-recover"
  trying to recover from a paused postcopy. (since 3.0)
"completed"
  migration is finished.
"failed"
  some error occurred during migration process.
"colo"
  VM is in the process of fault tolerance, VM can not get into this state unless
  colo capability is enabled for migration. (since 2.8)
"pre-switchover"
  Paused before device serialisation. (since 2.11)
"device"
  During device serialisation when pause-before-switchover is enabled (since
  2.11)
"wait-unplug"
  wait for device unplug request by guest OS to be completed. (since 4.2)
Since: 2.3
MigrationInfo (Object)
Information about current migration process.
Members:
"status: MigrationStatus" (optional)
  "MigrationStatus" describing the current migration status. If this field is
  not returned, no migration process has been initiated
"ram: MigrationStats" (optional)
  "MigrationStats" containing detailed migration status, only returned if status
  is 'active' or 'completed'(since 1.2)
"disk: MigrationStats" (optional)
  "MigrationStats" containing detailed disk migration status, only returned if
  status is 'active' and it is a block migration
"xbzrle-cache: XBZRLECacheStats" (optional)
  "XBZRLECacheStats" containing detailed XBZRLE migration statistics, only
```

returned if XBZRLE feature is on and status is 'active' or 'completed' (since

"total-time: int" (optional) total amount of milliseconds since migration started. If migration has ended, it returns the total migration time. (since 1.2) "downtime: int" (optional) only present when migration finishes correctly total downtime in milliseconds for the guest. (since 1.3) "expected-downtime: int" (optional) only present while migration is active expected downtime in milliseconds for the guest in last walk of the dirty bitmap. (since 1.3) "setup-time: int" (optional) amount of setup time in milliseconds before the iterations begin but after the QMP command is issued. This is designed to provide an accounting of any activities (such as RDMA pinning) which may be expensive, but do not actually occur during the iterative migration rounds themselves. (since 1.6) "cpu-throttle-percentage: int" (optional) percentage of time guest cpus are being throttled during auto-converge. This is only present when auto-converge has started throttling guest cpus. (Since 2.7) "error-desc: string" (optional) the human readable error description string, when "status" is 'failed'. Clients should not attempt to parse the error strings. (Since 2.7) "postcopy-blocktime: int" (optional) total time when all vCPU were blocked during postcopy live migration. This is only present when the postcopy-blocktime migration capability is enabled. (Since 3.0) "postcopy-vcpu-blocktime: array of int" (optional) list of the postcopy blocktime per vCPU. This is only present when the postcopy-blocktime migration capability is enabled. (Since 3.0) "compression: CompressionStats" (optional) migration compression statistics, only returned if compression feature is on and status is 'active' or 'completed' (Since 3.1) "socket-address: array of SocketAddress" (optional)

Only used for tcp, to know what the real port is (Since 4.0)

Since: 0.14.0

query-migrate (Command) Returns information about current migration process. If migration is active there will be another json-object with RAM migration status and if block migration is active another one with block migration status.

```
Returns: "MigrationInfo"
Since: 0.14.0
Example:
     1. Before the first migration
     -> { "execute": "query-migrate" }
     <- { "return": {} }
     2. Migration is done and has succeeded
     -> { "execute": "query-migrate" }
     <- { "return": {
          "status": "completed",
          "total-time":12345,
          "setup-time":12345,
          "downtime":12345,
          "ram":{
           "transferred":123,
           "remaining":123,
           "total":246,
           "duplicate":123,
           "normal":123,
           "normal-bytes":123456,
           "dirty-sync-count":15
          }
        }
       }
     3. Migration is done and has failed
     -> { "execute": "query-migrate" }
     <- { "return": { "status": "failed" } }
     4. Migration is being performed and is not a block migration:
```

-> { "execute": "query-migrate" }

```
<- {
   "return":{
     "status":"active",
     "total-time":12345,
     "setup-time":12345,
     "expected-downtime":12345,
     "ram":{
       "transferred":123,
       "remaining":123,
       "total":246,
       "duplicate":123,
       "normal":123,
       "normal-bytes":123456,
       "dirty-sync-count":15
     }
   }
 }
5. Migration is being performed and is a block migration:
-> { "execute": "query-migrate" }
<- {
   "return":{
     "status": "active",
     "total-time":12345,
     "setup-time":12345,
     "expected-downtime":12345,
     "ram":{
       "total":1057024,
       "remaining":1053304,
       "transferred":3720,
       "duplicate":123,
       "normal":123,
       "normal-bytes":123456,
       "dirty-sync-count":15
```

```
},
     "disk":{
       "total":20971520,
       "remaining":20880384,
       "transferred":91136
     }
   }
 }
6. Migration is being performed and XBZRLE is active:
-> { "execute": "query-migrate" }
<- {
    "return":{
     "status":"active",
     "total-time":12345,
     "setup-time":12345,
     "expected-downtime":12345,
     "ram":{
       "total":1057024,
       "remaining":1053304,
       "transferred":3720,
       "duplicate":10,
       "normal":3333,
       "normal-bytes":3412992,
       "dirty-sync-count":15
     },
     "xbzrle-cache":{
       "cache-size":67108864,
       "bytes":20971520,
       "pages":2444343,
       "cache-miss":2244,
       "cache-miss-rate":0.123,
       "overflow":34434
```

}

```
}
MigrationCapability (Enum)
Migration capabilities enumeration
Values:
"xbzrle"
  Migration supports xbzrle (Xor Based Zero Run Length Encoding). This feature
  allows us to minimize migration traffic for certain work loads, by sending
  compressed difference of the pages
"rdma-pin-all"
  Controls whether or not the entire VM memory footprint is mlock()'d on demand
  or all at once. Refer to docs/rdma.txt for usage. Disabled by default. (since
  2.0)
"zero-blocks"
  During storage migration encode blocks of zeroes efficiently. This essentially
  saves 1MB of zeroes per block on the wire. Enabling requires source and target
  VM to support this feature. To enable it is sufficient to enable the capability
  on the source VM. The feature is disabled by default. (since 1.6)
"compress"
  Use multiple compression threads to accelerate live migration. This feature
  can help to reduce the migration traffic, by sending compressed pages. Please
  note that if compress and xbzrle are both on, compress only takes effect in the
  ram bulk stage, after that, it will be disabled and only xbzrle takes effect,
  this can help to minimize migration traffic. The feature is disabled by
  default. (since 2.4)
"events"
  generate events for each migration state change (since 2.4)
"auto-converge"
  If enabled, QEMU will automatically throttle down the guest to speed up
  convergence of RAM migration. (since 1.6)
"postcopy-ram"
  Start executing on the migration target before all of RAM has been migrated,
```

pulling the remaining pages along as needed. The capacity must have the same

```
setting on both source and target or migration will not even start. NOTE: If
  the migration fails during postcopy the VM will fail. (since 2.6)
"x-colo"
  If enabled, migration will never end, and the state of the VM on the primary
  side will be migrated continuously to the VM on secondary side, this process is
  called COarse-Grain LOck Stepping (COLO) for Non-stop Service. (since 2.8)
"release-ram"
  if enabled, qemu will free the migrated ram pages on the source during
  postcopy-ram migration. (since 2.9)
"block"
  If enabled, QEMU will also migrate the contents of all block devices. Default
  is disabled. A possible alternative uses mirror jobs to a builtin NBD server
  on the destination, which offers more flexibility. (Since 2.10)
"return-path"
  If enabled, migration will use the return path even for precopy. (since 2.10)
"pause-before-switchover"
  Pause outgoing migration before serialising device state and before disabling
  block IO (since 2.11)
"multifd"
  Use more than one fd for migration (since 4.0)
"dirty-bitmaps"
  If enabled, QEMU will migrate named dirty bitmaps. (since 2.12)
"postcopy-blocktime"
  Calculate downtime for postcopy live migration (since 3.0)
"late-block-activate"
  If enabled, the destination will not activate block devices (and thus take
  locks) immediately at the end of migration. (since 3.0)
"x-ignore-shared"
  If enabled, QEMU will not migrate shared memory (since 4.0)
"validate-uuid"
  Send the UUID of the source to allow the destination to ensure it is the same.
  (since 4.2)
```

Since: 1.2 Page 226/325

```
MigrationCapabilityStatus (Object)
Migration capability information
Members:
"capability: MigrationCapability"
  capability enum
"state: boolean"
  capability state bool
Since: 1.2
migrate-set-capabilities (Command) Enable/Disable the following migration
capabilities (like xbzrle)
Arguments:
"capabilities: array of MigrationCapabilityStatus"
  json array of capability modifications to make
Since: 1.2
Example:
     -> { "execute": "migrate-set-capabilities", "arguments":
        { "capabilities": [ { "capability": "xbzrle", "state": true } ] } }
query-migrate-capabilities (Command) Returns information about the current
migration capabilities status
Returns: "MigrationCapabilitiesStatus"
Since: 1.2
Example:
     -> { "execute": "query-migrate-capabilities" }
     <- { "return": [
         {"state": false, "capability": "xbzrle"},
         {"state": false, "capability": "rdma-pin-all"},
         {"state": false, "capability": "auto-converge"},
         {"state": false, "capability": "zero-blocks"},
         {"state": false, "capability": "compress"},
         {"state": true, "capability": "events"},
         {"state": false, "capability": "postcopy-ram"},
         {"state": false, "capability": "x-colo"}
```

]}

MigrationParameter (Enum)

Migration parameters enumeration

Values:

"announce-initial"

Initial delay (in milliseconds) before sending the first announce (Since 4.0)

"announce-max"

Maximum delay (in milliseconds) between packets in the announcement (Since 4.0)

"announce-rounds"

Number of self-announce packets sent after migration (Since 4.0)

"announce-step"

Increase in delay (in milliseconds) between subsequent packets in the announcement (Since 4.0)

"compress-level"

Set the compression level to be used in live migration, the compression level is an integer between 0 and 9, where 0 means no compression, 1 means the best compression speed, and 9 means best compression ratio which will consume more CPU.

"compress-threads"

Set compression thread count to be used in live migration, the compression thread count is an integer between 1 and 255.

"compress-wait-thread"

Controls behavior when all compression threads are currently busy. If true (default), wait for a free compression thread to become available; otherwise, send the page uncompressed. (Since 3.1)

"decompress-threads"

Set decompression thread count to be used in live migration, the decompression thread count is an integer between 1 and 255. Usually, decompression is at least 4 times as fast as compression, so set the decompress-threads to the number about 1/4 of compress-threads is adequate.

"cpu-throttle-initial"

Initial percentage of time guest cpus are throttled when migration autoconverge is activated. The default value is 20. (Since 2.7)

"cpu-throttle-increment" Page 228/325

throttle percentage increase each time auto-converge detects that migration is not making progress. The default value is 10. (Since 2.7)

#### "tls-creds"

ID of the 'tls-creds' object that provides credentials for establishing a TLS connection over the migration data channel. On the outgoing side of the migration, the credentials must be for a 'client' endpoint, while for the incoming side the credentials must be for a 'server' endpoint. Setting this will enable TLS for all migrations. The default is unset, resulting in unsecured migration at the QEMU level. (Since 2.7)

#### "tls-hostname"

hostname of the target host for the migration. This is required when using x509 based TLS credentials and the migration URI does not already include a hostname. For example if using fd: or exec: based migration, the hostname must be provided so that the server's x509 certificate identity can be validated. (Since 2.7)

## "tls-authz"

ID of the 'authz' object subclass that provides access control checking of the TLS x509 certificate distinguished name. This object is only resolved at time of use, so can be deleted and recreated on the fly while the migration server is active. If missing, it will default to denying access (Since 4.0)

## "max-bandwidth"

to set maximum speed for migration. maximum speed in bytes per second. (Since 2.8)

## "downtime-limit"

set maximum tolerated downtime for migration. maximum downtime in milliseconds (Since 2.8)

## "x-checkpoint-delay"

The delay time (in ms) between two COLO checkpoints in periodic mode. (Since 2.8)

#### "block-incremental"

Affects how much storage is migrated when the block migration capability is enabled. When false, the entire storage backing chain is migrated into a flattened image at the destination; when true, only the active gcow2 layer is

```
migrated and the destination must already have access to the same backing chain
  as was used on the source. (since 2.10)
"multifd-channels"
  Number of channels used to migrate data in parallel. This is the same number
  that the number of sockets used for migration. The default value is 2 (since
  4.0)
"xbzrle-cache-size"
  cache size to be used by XBZRLE migration. It needs to be a multiple of the
  target page size and a power of 2 (Since 2.11)
"max-postcopy-bandwidth"
  Background transfer bandwidth during postcopy. Defaults to 0 (unlimited). In
  bytes per second. (Since 3.0)
"max-cpu-throttle"
  maximum cpu throttle percentage. Defaults to 99. (Since 3.1)
Since: 2.4
MigrateSetParameters (Object)
Members:
"announce-initial: int" (optional)
  Initial delay (in milliseconds) before sending the first announce (Since 4.0)
"announce-max: int" (optional)
  Maximum delay (in milliseconds) between packets in the announcement (Since 4.0)
"announce-rounds: int" (optional)
  Number of self-announce packets sent after migration (Since 4.0)
"announce-step: int" (optional)
  Increase in delay (in milliseconds) between subsequent packets in the
  announcement (Since 4.0)
"compress-level: int" (optional)
  compression level
"compress-threads: int" (optional)
  compression thread count
"compress-wait-thread: boolean" (optional)
  Controls behavior when all compression threads are currently busy. If true
```

(default), wait for a free compression thread to become available; otherwise,

send the page uncompressed. (Since 3.1)

"decompress-threads: int" (optional)

decompression thread count

"cpu-throttle-initial: int" (optional)

Initial percentage of time guest cpus are throttled when migration auto-

converge is activated. The default value is 20. (Since 2.7)

"cpu-throttle-increment: int" (optional)

throttle percentage increase each time auto-converge detects that migration is

not making progress. The default value is 10. (Since 2.7)

"tls-creds: StrOrNull" (optional)

ID of the 'tls-creds' object that provides credentials for establishing a TLS connection over the migration data channel. On the outgoing side of the migration, the credentials must be for a 'client' endpoint, while for the incoming side the credentials must be for a 'server' endpoint. Setting this to a non-empty string enables TLS for all migrations. An empty string means that QEMU will use plain text mode for migration, rather than TLS (Since 2.9) Previously (since 2.7), this was reported by omitting tls-creds instead.

"tls-hostname: StrOrNull" (optional)

hostname of the target host for the migration. This is required when using x509 based TLS credentials and the migration URI does not already include a hostname. For example if using fd: or exec: based migration, the hostname must be provided so that the server's x509 certificate identity can be validated. (Since 2.7) An empty string means that QEMU will use the hostname associated with the migration URI, if any. (Since 2.9) Previously (since 2.7), this was

"max-bandwidth: int" (optional)

to set maximum speed for migration. maximum speed in bytes per second. (Since 2.8)

"downtime-limit: int" (optional)

reported by omitting tls-hostname instead.

set maximum tolerated downtime for migration. maximum downtime in milliseconds

(Since 2.8)

"x-checkpoint-delay: int" (optional)

the delay time between two COLO checkpoints. (Since 2.8)

```
"block-incremental: boolean" (optional)
  Affects how much storage is migrated when the block migration capability is
  enabled. When false, the entire storage backing chain is migrated into a
  flattened image at the destination; when true, only the active qcow2 layer is
  migrated and the destination must already have access to the same backing chain
  as was used on the source. (since 2.10)
"multifd-channels: int" (optional)
  Number of channels used to migrate data in parallel. This is the same number
  that the number of sockets used for migration. The default value is 2 (since
  4.0)
"xbzrle-cache-size: int" (optional)
  cache size to be used by XBZRLE migration. It needs to be a multiple of the
  target page size and a power of 2 (Since 2.11)
"max-postcopy-bandwidth: int" (optional)
  Background transfer bandwidth during postcopy. Defaults to 0 (unlimited). In
  bytes per second. (Since 3.0)
"max-cpu-throttle: int" (optional)
  maximum cpu throttle percentage. The default value is 99. (Since 3.1)
"tls-authz: StrOrNull" (optional)
  Not documented
Since: 2.4
migrate-set-parameters (Command) Set various migration parameters.
Arguments: the members of "MigrateSetParameters"
Since: 2.4
Example:
     -> { "execute": "migrate-set-parameters",
        "arguments": { "compress-level": 1 } }
MigrationParameters (Object)
The optional members aren't actually optional.
Members:
"announce-initial: int" (optional)
  Initial delay (in milliseconds) before sending the first announce (Since 4.0)
```

"announce-max: int" (optional)

Maximum delay (in milliseconds) between packets in the announcement (Since 4.0) "announce-rounds: int" (optional) Number of self-announce packets sent after migration (Since 4.0) "announce-step: int" (optional)

Increase in delay (in milliseconds) between subsequent packets in the

announcement (Since 4.0)

"compress-level: int" (optional)

compression level

"compress-threads: int" (optional)

compression thread count

"compress-wait-thread: boolean" (optional)

Controls behavior when all compression threads are currently busy. If true (default), wait for a free compression thread to become available; otherwise, send the page uncompressed. (Since 3.1)

"decompress-threads: int" (optional)

decompression thread count

"cpu-throttle-initial: int" (optional)

Initial percentage of time guest cpus are throttled when migration auto-

"cpu-throttle-increment: int" (optional)

converge is activated. (Since 2.7)

throttle percentage increase each time auto-converge detects that migration is not making progress. (Since 2.7)

"tls-creds: string" (optional)

ID of the 'tls-creds' object that provides credentials for establishing a TLS connection over the migration data channel. On the outgoing side of the migration, the credentials must be for a 'client' endpoint, while for the incoming side the credentials must be for a 'server' endpoint. An empty string means that QEMU will use plain text mode for migration, rather than TLS (Since 2.7) Note: 2.8 reports this by omitting tls-creds instead.

"tls-hostname: string" (optional)

hostname of the target host for the migration. This is required when using x509 based TLS credentials and the migration URI does not already include a hostname. For example if using fd: or exec: based migration, the hostname must

be provided so that the server's x509 certificate identity can be validated. (Since 2.7) An empty string means that QEMU will use the hostname associated with the migration URI, if any. (Since 2.9) Note: 2.8 reports this by omitting tls-hostname instead. "tls-authz: string" (optional) ID of the 'authz' object subclass that provides access control checking of the TLS x509 certificate distinguished name. (Since 4.0) "max-bandwidth: int" (optional) to set maximum speed for migration. maximum speed in bytes per second. (Since 2.8) "downtime-limit: int" (optional) set maximum tolerated downtime for migration. maximum downtime in milliseconds (Since 2.8) "x-checkpoint-delay: int" (optional) the delay time between two COLO checkpoints. (Since 2.8) "block-incremental: boolean" (optional) Affects how much storage is migrated when the block migration capability is enabled. When false, the entire storage backing chain is migrated into a flattened image at the destination; when true, only the active qcow2 layer is migrated and the destination must already have access to the same backing chain as was used on the source. (since 2.10) "multifd-channels: int" (optional) Number of channels used to migrate data in parallel. This is the same number that the number of sockets used for migration. The default value is 2 (since 4.0)"xbzrle-cache-size: int" (optional) cache size to be used by XBZRLE migration. It needs to be a multiple of the target page size and a power of 2 (Since 2.11) "max-postcopy-bandwidth: int" (optional) Background transfer bandwidth during postcopy. Defaults to 0 (unlimited). In bytes per second. (Since 3.0)

"max-cpu-throttle: int" (optional)

maximum cpu throttle percentage. Defaults to 99. (Since 3.1)

Since: 2.4 query-migrate-parameters (Command) Returns information about the current migration parameters Returns: "MigrationParameters" Since: 2.4 Example: -> { "execute": "query-migrate-parameters" } <- { "return": { "decompress-threads": 2, "cpu-throttle-increment": 10, "compress-threads": 8, "compress-level": 1, "cpu-throttle-initial": 20, "max-bandwidth": 33554432, "downtime-limit": 300 } } client migrate info (Command) Set migration information for remote display. This makes the server ask the client to automatically reconnect using the new parameters once migration finished successfully. Only implemented for SPICE. Arguments: "protocol: string" must be "spice" "hostname: string" migration target hostname "port: int" (optional) spice tcp port for plaintext channels "tls-port: int" (optional) spice tcp port for tls-secured channels "cert-subject: string" (optional) server certificate subject Since: 0.14.0

Example: Page 235/325

```
-> { "execute": "client migrate info",
        "arguments": { "protocol": "spice",
                 "hostname": "virt42.lab.kraxel.org",
                 "port": 1234 } }
     <- { "return": {} }
migrate-start-postcopy (Command) Followup to a migration command to switch the
migration to postcopy mode. The postcopy-ram capability must be set on both source
and destination before the original migration command.
Since: 2.5
Example:
    -> { "execute": "migrate-start-postcopy" }
     <- { "return": {} }
MIGRATION (Event) Emitted when a migration event happens
Arguments:
"status: MigrationStatus"
  "MigrationStatus" describing the current migration status.
Since: 2.4
Example:
     <- {"timestamp": {"seconds": 1432121972, "microseconds": 744001},
       "event": "MIGRATION",
       "data": {"status": "completed"} }
MIGRATION_PASS (Event) Emitted from the source side of a migration at the start of
each pass (when it syncs the dirty bitmap)
Arguments:
"pass: int"
  An incrementing count (starting at 1 on the first pass)
Since: 2.6
Example:
    { "timestamp": {"seconds": 1449669631, "microseconds": 239225},
      "event": "MIGRATION_PASS", "data": {"pass": 2} }
COLOMessage (Enum)
```

The message transmission between Primary side and Secondary side.

Values: Page 236/325

```
"checkpoint-ready"
  Secondary VM (SVM) is ready for checkpointing
"checkpoint-request"
  Primary VM (PVM) tells SVM to prepare for checkpointing
"checkpoint-reply"
  SVM gets PVM's checkpoint request
"vmstate-send"
  VM's state will be sent by PVM.
"vmstate-size"
  The total size of VMstate.
"vmstate-received"
  VM's state has been received by SVM.
"vmstate-loaded"
  VM's state has been loaded by SVM.
Since: 2.8
COLOMode (Enum)
The COLO current mode.
Values:
"none"
  COLO is disabled.
"primary"
  COLO node in primary side.
"secondary"
  COLO node in slave side.
Since: 2.8
FailoverStatus (Enum)
An enumeration of COLO failover status
Values:
"none"
  no failover has ever happened
"require"
  got failover requirement but not handled
```

"active"

Page 237/325

```
in the process of doing failover
"completed"
  finish the process of failover
"relaunch"
  restart the failover process, from 'none' -> 'completed' (Since 2.9)
Since: 2.8
COLO_EXIT (Event) Emitted when VM finishes COLO mode due to some errors happening
or at the request of users.
Arguments:
"mode: COLOMode"
  report COLO mode when COLO exited.
"reason: COLOExitReason"
  describes the reason for the COLO exit.
Since: 3.1
Example:
     <- { "timestamp": {"seconds": 2032141960, "microseconds": 417172},
        "event": "COLO_EXIT", "data": {"mode": "primary", "reason": "request" } }
COLOExitReason (Enum)
The reason for a COLO exit.
Values:
"none"
  failover has never happened. This state does not occur in the COLO_EXIT event,
  and is only visible in the result of query-colo-status.
"request"
  COLO exit is due to an external request.
"error"
  COLO exit is due to an internal error.
"processing"
  COLO is currently handling a failover (since 4.0).
Since: 3.1
x-colo-lost-heartbeat (Command) Tell gemu that heartbeat is lost, request it to do
takeover procedures. If this command is sent to the PVM, the Primary side will
```

exit COLO mode. If sent to the Secondary, the Secondary side will run failover

work, then takes over server operation to become the service VM. Since: 2.8 Example: -> { "execute": "x-colo-lost-heartbeat" } <- { "return": {} } migrate\_cancel (Command) Cancel the current executing migration process. Returns: nothing on success Notes: This command succeeds even if there is no migration process running. Since: 0.14.0 Example: -> { "execute": "migrate\_cancel" } <- { "return": {} } migrate-continue (Command) Continue migration when it's in a paused state. Arguments: "state: MigrationStatus" The state the migration is currently expected to be in Returns: nothing on success Since: 2.11 Example: -> { "execute": "migrate-continue", "arguments": { "state": "pre-switchover" } } <- { "return": {} } migrate\_set\_downtime (Command) Set maximum tolerated downtime for migration. Arguments: "value: number" maximum downtime in seconds Returns: nothing on success Notes: This command is deprecated in favor of 'migrate-set-parameters' Since: 0.14.0 Example: -> { "execute": "migrate\_set\_downtime", "arguments": { "value": 0.1 } } <- { "return": {} }

migrate\_set\_speed (Command) Set maximum speed for migration.

```
Arguments:
"value: int"
  maximum speed in bytes per second.
Returns: nothing on success
Notes: This command is deprecated in favor of 'migrate-set-parameters'
Since: 0.14.0
Example:
    -> { "execute": "migrate_set_speed", "arguments": { "value": 1024 } }
     <- { "return": {} }
migrate-set-cache-size (Command) Set cache size to be used by XBZRLE migration
Arguments:
"value: int"
  cache size in bytes
The size will be rounded down to the nearest power of 2. The cache size can be
modified before and during ongoing migration
Returns: nothing on success
Notes: This command is deprecated in favor of 'migrate-set-parameters'
Since: 1.2
Example:
    -> { "execute": "migrate-set-cache-size",
        "arguments": { "value": 536870912 } }
     <- { "return": {} }
query-migrate-cache-size (Command) Query migration XBZRLE cache size
Returns: XBZRLE cache size in bytes
Notes: This command is deprecated in favor of 'query-migrate-parameters'
Since: 1.2
Example:
    -> { "execute": "query-migrate-cache-size" }
     <- { "return": 67108864 }
migrate (Command) Migrates the current running guest to another Virtual Machine.
Arguments:
"uri: string"
```

```
"blk: boolean" (optional)
  do block migration (full disk copy)
"inc: boolean" (optional)
  incremental disk copy migration
"detach: boolean" (optional)
  this argument exists only for compatibility reasons and is ignored by QEMU
"resume: boolean" (optional)
  resume one paused migration, default "off". (since 3.0)
Returns: nothing on success
Since: 0.14.0
Notes:
1. The 'query-migrate' command should be used to check migration's progress and
  final result (this information is provided by the 'status' member)
2. All boolean arguments default to false
3. The user Monitor's "detach" argument is invalid in QMP and should not be used
Example:
    -> { "execute": "migrate", "arguments": { "uri": "tcp:0:4446" } }
     <- { "return": {} }
migrate-incoming (Command) Start an incoming migration, the gemu must have been
```

migrate-incoming (Command) Start an incoming migration, the qemu must have been started with -incoming defer

Arguments:

"uri: string"

The Uniform Resource Identifier identifying the source or address to listen on

Returns: nothing on success

Since: 2.3

Notes:

- It's a bad idea to use a string for the uri, but it needs to stay compatible with -incoming and the format of the uri is already exposed above libvirt.
- 2. QEMU must be started with -incoming defer to allow migrate-incoming to be used.
- 3. The uri format is the same as for -incoming

Example:

```
<- { "return": {} }
xen-save-devices-state (Command) Save the state of all devices to file. The RAM
and the block devices of the VM are not saved by this command.
Arguments:
"filename: string"
  the file to save the state of the devices to as binary data. See
  xen-save-devices-state.txt for a description of the binary format.
"live: boolean" (optional)
  Optional argument to ask QEMU to treat this command as part of a live
  migration. Default to true. (since 2.11)
Returns: Nothing on success
Since: 1.1
Example:
     -> { "execute": "xen-save-devices-state",
        "arguments": { "filename": "/tmp/save" } }
     <- { "return": {} }
xen-set-replication (Command) Enable or disable replication.
Arguments:
"enable: boolean"
  true to enable, false to disable.
"primary: boolean"
  true for primary or false for secondary.
"failover: boolean" (optional)
  true to do failover, false to stop. but cannot be specified if 'enable' is
  true. default value is false.
Returns: nothing.
Example:
     -> { "execute": "xen-set-replication",
        "arguments": {"enable": true, "primary": false} }
     <- { "return": {} }
Since: 2.9
If: "defined(CONFIG_REPLICATION)"
```

The result format for 'query-xen-replication-status'. Members: "error: boolean" true if an error happened, false if replication is normal. "desc: string" (optional) the human readable error description string, when "error" is 'true'. Since: 2.9 If: "defined(CONFIG\_REPLICATION)" query-xen-replication-status (Command) Query replication status while the vm is running. Returns: A "ReplicationResult" object showing the status. Example: -> { "execute": "query-xen-replication-status" } <- { "return": { "error": false } } Since: 2.9 If: "defined(CONFIG\_REPLICATION)" xen-colo-do-checkpoint (Command) Xen uses this command to notify replication to trigger a checkpoint. Returns: nothing. Example: -> { "execute": "xen-colo-do-checkpoint" } <- { "return": {} } Since: 2.9 If: "defined(CONFIG\_REPLICATION)" COLOStatus (Object) The result format for 'query-colo-status'. Members: "mode: COLOMode" COLO running mode. If COLO is running, this field will return 'primary' or 'secondary'. "last-mode: COLOMode" COLO last running mode. If COLO is running, this field will return same like

mode field, after failover we can use this field to get last colo mode. (since

```
4.0)
"reason: COLOExitReason"
  describes the reason for the COLO exit.
Since: 3.1
query-colo-status (Command) Query COLO status while the vm is running.
Returns: A "COLOStatus" object showing the status.
Example:
     -> { "execute": "query-colo-status" }
     <- { "return": { "mode": "primary", "reason": "request" } }
Since: 3.1
migrate-recover (Command) Provide a recovery migration stream URI.
Arguments:
"uri: string"
  the URI to be used for the recovery of migration stream.
Returns: nothing.
Example:
     -> { "execute": "migrate-recover",
        "arguments": { "uri": "tcp:192.168.1.200:12345" } }
     <- { "return": {} }
Since: 3.0
migrate-pause (Command) Pause a migration. Currently it only supports postcopy.
Returns: nothing.
Example:
     -> { "execute": "migrate-pause" }
     <- { "return": {} }
Since: 3.0
UNPLUG_PRIMARY (Event) Emitted from source side of a migration when migration
state is WAIT_UNPLUG. Device was unplugged by guest operating system. Device
resources in QEMU are kept on standby to be able to re-plug it in case of migration
failure.
Arguments:
```

Page 244/325

"device-id: string"

Since: 4.2

Example:

{"event": "UNPLUG\_PRIMARY", "data": {"device-id": "hostdev0"} }

**Transactions** 

Abort (Object)

This action can be used to test transaction failure.

Since: 1.6

ActionCompletionMode (Enum)

An enumeration of Transactional completion modes.

Values:

"individual"

Do not attempt to cancel any other Actions if any Actions fail after the

Transaction request succeeds. All Actions that can complete successfully will

do so without waiting on others. This is the default.

"grouped"

If any Action fails after the Transaction succeeds, cancel all Actions. Actions do not complete until all Actions are ready to complete. May be rejected by Actions that do not support this completion mode.

Since: 2.5

TransactionAction (Object)

A discriminated record of operations that can be performed with "transaction".

Action "type" can be:

"abort": since 1.6

- "block-dirty-bitmap-add": since 2.5

"block-dirty-bitmap-remove": since 4.2

"block-dirty-bitmap-clear": since 2.5

- "block-dirty-bitmap-enable": since 4.0

- "block-dirty-bitmap-disable": since 4.0

- "block-dirty-bitmap-merge": since 4.0

"blockdev-backup": since 2.3

- "blockdev-snapshot": since 2.5

- "blockdev-snapshot-internal-sync": since 1.7

- "blockdev-snapshot-sync": since 1.1

- "drive-backup": since 1.6 Members: "type" "data: Abort" when "type" is "abort"

One of "abort", "block-dirty-bitmap-add", "block-dirty-bitmap-remove", "block-

dirty-bitmap-clear", "block-dirty-bitmap-enable", "block-dirty-bitmap-disable",

"block-dirty-bitmap-merge", "blockdev-backup", "blockdev-snapshot", "blockdev-

snapshot-internal-sync", "blockdev-snapshot-sync", "drive-backup"

"data: BlockDirtyBitmapAdd" when "type" is "block-dirty-bitmap-add"

"data: BlockDirtyBitmap" when "type" is "block-dirty-bitmap-remove"

"data: BlockDirtyBitmap" when "type" is "block-dirty-bitmap-clear"

"data: BlockDirtyBitmap" when "type" is "block-dirty-bitmap-enable"

"data: BlockDirtyBitmap" when "type" is "block-dirty-bitmap-disable"

"data: BlockDirtyBitmapMerge" when "type" is "block-dirty-bitmap-merge"

"data: BlockdevBackup" when "type" is "blockdev-backup"

"data: BlockdevSnapshot" when "type" is "blockdev-snapshot"

"data: BlockdevSnapshotInternal" when "type" is "blockdev-snapshot-internal-sync"

"data: BlockdevSnapshotSync" when "type" is "blockdev-snapshot-sync"

"data: DriveBackup" when "type" is "drive-backup"

Since: 1.1

TransactionProperties (Object)

Optional arguments to modify the behavior of a Transaction.

Members:

"completion-mode: ActionCompletionMode" (optional)

Controls how jobs launched asynchronously by Actions will complete or fail as a group. See "ActionCompletionMode" for details.

Since: 2.5

transaction (Command) Executes a number of transactionable QMP commands atomically. If any operation fails, then the entire set of actions will be abandoned and the appropriate error returned.

For external snapshots, the dictionary contains the device, the file to use for the new snapshot, and the format. The default format, if not specified, is qcow2.

Each new snapshot defaults to being created by QEMU (wiping any contents if the

file already exists), but it is also possible to reuse an externally-created file.

In the latter case, you should ensure that the new image file has the same contents as the current one; QEMU cannot perform any meaningful check. Typically this is achieved by using the current image file as the backing file for the new image.

On failure, the original disks pre-snapshot attempt will be used.

For internal snapshots, the dictionary contains the device and the snapshot's name.

If an internal snapshot matching name already exists, the request will be rejected.

Only some image formats support it, for example, qcow2, rbd, and sheepdog.

On failure, qemu will try delete the newly created internal snapshot in the transaction. When an I/O error occurs during deletion, the user needs to fix it later with qemu-img or other command.

Arguments:

"actions: array of TransactionAction"

List of "TransactionAction"; information needed for the respective operations.

"properties: TransactionProperties" (optional)

structure of additional options to control the execution of the transaction.

See "TransactionProperties" for additional detail.

Returns: nothing on success

Errors depend on the operations of the transaction

Note: The transaction aborts on the first failure. Therefore, there will be information on only one failed operation returned in an error condition, and subsequent actions will not have been attempted.

Since: 1.1

Example:

```
{ "type": "blockdev-snapshot-sync", "data" : { "device": "ide-hd1",
                               "snapshot-file": "/some/place/my-image2",
                               "mode": "existing",
                               "format": "qcow2" } },
             { "type": "blockdev-snapshot-internal-sync", "data" : {
                               "device": "ide-hd2",
                               "name": "snapshot0" } } ] } }
       <- { "return": {} }
Tracing
  TraceEventState (Enum)
  State of a tracing event.
  Values:
  "unavailable"
     The event is statically disabled.
  "disabled"
     The event is dynamically disabled.
  "enabled"
     The event is dynamically enabled.
  Since: 2.2
  TraceEventInfo (Object)
  Information of a tracing event.
  Members:
  "name: string"
     Event name.
  "state: TraceEventState"
     Tracing state.
  "vcpu: boolean"
     Whether this is a per-vCPU event (since 2.7).
  An event is per-vCPU if it has the "vcpu" property in the "trace-events" files.
  Since: 2.2
  trace-event-get-state (Command) Query the state of events.
```

"format": "qcow2" } },

Arguments: Page 248/325

"name: string"

Event name pattern (case-sensitive glob).

"vcpu: int" (optional)

The vCPU to query (any by default; since 2.7).

Returns: a list of "TraceEventInfo" for the matching events

An event is returned if:

- its name matches the "name" pattern, and
- if "vcpu" is given, the event has the "vcpu" property.

Therefore, if "vcpu" is given, the operation will only match per-vCPU events, returning their state on the specified vCPU. Special case: if "name" is an exact match, "vcpu" is given and the event does not have the "vcpu" property, an error is returned.

Since: 2.2

# Example:

```
-> { "execute": "trace-event-get-state",
    "arguments": { "name": "qemu_memalign" } }
<- { "return": [ { "name": "qemu_memalign", "state": "disabled" } ] }</pre>
```

trace-event-set-state (Command) Set the dynamic tracing state of events.

Arguments:

"name: string"

Event name pattern (case-sensitive glob).

"enable: boolean"

Whether to enable tracing.

"ignore-unavailable: boolean" (optional)

Do not match unavailable events with "name".

"vcpu: int" (optional)

The vCPU to act upon (all by default; since 2.7).

An event's state is modified if:

- its name matches the "name" pattern, and
- if "vcpu" is given, the event has the "vcpu" property.

Therefore, if "vcpu" is given, the operation will only match per-vCPU events, setting their state on the specified vCPU. Special case: if "name" is an exact match, "vcpu" is given and the event does not have the "vcpu" property, an error is

```
returned.
```

Since: 2.2

## Example:

```
-> { "execute": "trace-event-set-state",
    "arguments": { "name": "qemu_memalign", "enable": "true" } }
<- { "return": {} }</pre>
```

## QMP introspection

query-qmp-schema (Command) Command query-qmp-schema exposes the QMP wire ABI as an array of SchemaInfo. This lets QMP clients figure out what commands and events are available in this QEMU, and their parameters and results.

However, the Schemalnfo can't reflect all the rules and restrictions that apply to QMP. It's interface introspection (figuring out what's there), not interface specification. The specification is in the QAPI schema.

Furthermore, while we strive to keep the QMP wire format backwards-compatible across qemu versions, the introspection output is not guaranteed to have the same stability. For example, one version of qemu may list an object member as an optional non-variant, while another lists the same member only through the object's variants; or the type of a member may change from a generic string into a specific enum or from one specific type into an alternate that includes the original type alongside something else.

Returns: array of "SchemaInfo", where each element describes an entity in the ABI: command, event, type, ...

The order of the various Schemalnfo is unspecified; however, all names are guaranteed to be unique (no name will be duplicated with different meta-types).

Note: the QAPI schema is also used to help define internal interfaces, by defining QAPI types. These are not part of the QMP wire ABI, and therefore not returned by this command.

Since: 2.5

SchemaMetaType (Enum)

This is a "SchemaInfo"'s meta type, i.e. the kind of entity it describes.

Values:

"builtin"

a predefined type such as 'int' or 'bool'.

```
"enum"
  an enumeration type
"array"
  an array type
"object"
  an object type (struct or union)
"alternate"
  an alternate type
"command"
  a QMP command
"event"
  a QMP event
Since: 2.5
SchemaInfo (Object)
Members:
"name: string"
  the entity's name, inherited from "base". The Schemalnfo is always referenced
  by this name. Commands and events have the name defined in the QAPI schema.
  Unlike command and event names, type names are not part of the wire ABI.
  Consequently, type names are meaningless strings here, although they are still
  guaranteed unique regardless of "meta-type".
"meta-type: SchemaMetaType"
  the entity's meta type, inherited from "base".
The members of "SchemaInfoBuiltin" when "meta-type" is "builtin"
The members of "SchemaInfoEnum" when "meta-type" is "enum"
The members of "SchemaInfoArray" when "meta-type" is "array"
The members of "SchemaInfoObject" when "meta-type" is "object"
The members of "SchemaInfoAlternate" when "meta-type" is "alternate"
The members of "SchemalnfoCommand" when "meta-type" is "command"
The members of "SchemaInfoEvent" when "meta-type" is "event"
Additional members depend on the value of "meta-type".
Since: 2.5
```

Additional Schemalnfo members for meta-type 'builtin'. Members: "json-type: JSONType" the JSON type used for this type on the wire. Since: 2.5 JSONType (Enum) The four primitive and two structured types according to RFC 8259 section 1, plus 'int' (split off 'number'), plus the obvious top type 'value'. Values: "string" Not documented "number" Not documented "int" Not documented "boolean" Not documented "null" Not documented "object" Not documented "array" Not documented "value" Not documented Since: 2.5 SchemaInfoEnum (Object) Additional Schemalnfo members for meta-type 'enum'. Members: "values: array of string" the enumeration type's values, in no particular order.

Since: 2.5 Page 252/325

Values of this type are JSON string on the wire.

SchemaInfoArray (Object) Additional Schemalnfo members for meta-type 'array'. Members: "element-type: string" the array type's element type. Values of this type are JSON array on the wire. Since: 2.5 SchemaInfoObject (Object) Additional Schemalnfo members for meta-type 'object'. Members: "members: array of SchemaInfoObjectMember" the object type's (non-variant) members, in no particular order. "tag: string" (optional) the name of the member serving as type tag. An element of "members" with this name must exist. "variants: array of SchemaInfoObjectVariant" (optional) variant members, i.e. additional members that depend on the type tag's value. Present exactly when "tag" is present. The variants are in no particular order, and may even differ from the order of the values of the enum type of the "tag". "features: array of string" (optional) names of features associated with the type, in no particular order. (since: 4.1) Values of this type are JSON object on the wire. Since: 2.5 SchemaInfoObjectMember (Object) An object member. Members: "name: string" the member's name, as defined in the QAPI schema. "type: string" the name of the member's type.

"default: value" (optional)

default when used as command parameter. If absent, the parameter is mandatory. If present, the value must be null. The parameter is optional, and behavior when it's missing is not specified here. Future extension: if present and nonnull, the parameter is optional, and defaults to this value. Since: 2.5 SchemaInfoObjectVariant (Object) The variant members for a value of the type tag. Members: "case: string" a value of the type tag. "type: string" the name of the object type that provides the variant members when the type tag has value "case". Since: 2.5 SchemaInfoAlternate (Object) Additional Schemalnfo members for meta-type 'alternate'. Members: "members: array of SchemaInfoAlternateMember" the alternate type's members, in no particular order. The members' wire encoding is distinct, see docs/devel/qapi-code-gen.txt section Alternate types. On the wire, this can be any of the members. Since: 2.5 SchemaInfoAlternateMember (Object) An alternate member. Members: "type: string" the name of the member's type. Since: 2.5 SchemaInfoCommand (Object) Additional Schemalnfo members for meta-type 'command'. Members: "arg-type: string"

the name of the object type that provides the command's parameters.

"ret-type: string" the name of the command's result type. "allow-oob: boolean" (optional) whether the command allows out-of-band execution, defaults to false (Since: 2.12) "features: array of string" (optional) names of features associated with the command, in no particular order. (since 4.2)TODO: "success-response" (currently irrelevant, because it's QGA, not QMP) Since: 2.5 SchemaInfoEvent (Object) Additional Schemalnfo members for meta-type 'event'. Members: "arg-type: string" the name of the object type that provides the event's parameters. Since: 2.5 QEMU Object Model (QOM) ObjectPropertyInfo (Object) Members: "name: string" the name of the property "type: string" the type of the property. This will typically come in one of four forms: 1) A primitive type such as 'u8', 'u16', 'bool', 'str', or 'double'. These types are mapped to the appropriate JSON type. 2) A child type in the form 'child<subtype>' where subtype is a gdev device type name. Child properties create the composition tree. 3) A link type in the form 'link<subtype>' where subtype is a qdev device type name. Link properties form the device model graph. "description: string" (optional) if specified, the description of the property. Since: 1.2

qom-list (Command) This command will list any properties of a object given a path

in the object model.

Arguments:

"path: string"

the path within the object model. See "qom-get" for a description of this parameter.

Returns: a list of "ObjectPropertyInfo" that describe the properties of the object.

Since: 1.2

Example:

qom-get (Command) This command will get a property from a object model path and return the value.

Arguments:

"path: string"

The path within the object model. There are two forms of supported paths--absolute and partial paths.

Absolute paths are derived from the root object and can follow child<> or link<> properties. Since they can follow link<> properties, they can be arbitrarily long. Absolute paths look like absolute filenames and are prefixed with a leading slash.

Partial paths look like relative filenames. They do not begin with a prefix.

The matching rules for partial paths are subtle but designed to make specifying objects easy. At each level of the composition tree, the partial path is matched as an absolute path. The first match is not returned. At least two matches are searched for. A successful result is only returned if only one match is found. If more than one match is found, a flag is return to indicate that the match was ambiguous.

"property: string"

Returns: The property value. The type depends on the property type. child<> and link<> properties are returned as #str pathnames. All integer property types (u8, u16, etc) are returned as #int. Since: 1.2 Example: 1. Use absolute path -> { "execute": "qom-get", "arguments": { "path": "/machine/unattached/device[0]", "property": "hotplugged" } } <- { "return": false } 2. Use partial path -> { "execute": "qom-get", "arguments": { "path": "unattached/sysbus", "property": "type" } } <- { "return": "System" } qom-set (Command) This command will set a property from a object model path. Arguments: "path: string" see "qom-get" for a description of this parameter "property: string" the property name to set "value: value" a value who's type is appropriate for the property type. See "qom-get" for a description of type mapping. Since: 1.2 Example: -> { "execute": "qom-set", "arguments": { "path": "/machine", "property": "graphics", "value": false } } <- { "return": {} }

This structure describes a search result from "gom-list-types"

ObjectTypeInfo (Object)

```
Members:
"name: string"
  the type name found in the search
"abstract: boolean" (optional)
  the type is abstract and can't be directly instantiated. Omitted if false.
  (since 2.10)
"parent: string" (optional)
  Name of parent type, if any (since 2.10)
Since: 1.1
qom-list-types (Command) This command will return a list of types given search
parameters
Arguments:
"implements: string" (optional)
  if specified, only return types that implement this type name
"abstract: boolean" (optional)
  if true, include abstract types in the results
Returns: a list of "ObjectTypeInfo" or an empty list if no results are found
Since: 1.1
qom-list-properties (Command) List properties associated with a QOM object.
Arguments:
"typename: string"
  the type name of an object
Note: objects can create properties at runtime, for example to describe links
between different devices and/or objects. These properties are not included in the
output of this command.
Returns: a list of ObjectPropertyInfo describing object properties
Since: 2.12
object-add (Command) Create a QOM object.
Arguments:
"qom-type: string"
  the class name for the object to be created
"id: string"
```

```
"props: value" (optional)
    a dictionary of properties to be passed to the backend
  Returns: Nothing on success Error if "gom-type" is not a valid class name
  Since: 2.0
  Example:
       -> { "execute": "object-add",
          "arguments": { "qom-type": "rng-random", "id": "rng1",
                    "props": { "filename": "/dev/hwrng" } } }
       <- { "return": {} }
  object-del (Command) Remove a QOM object.
  Arguments:
  "id: string"
    the name of the QOM object to remove
  Returns: Nothing on success Error if "id" is not a valid id for a QOM object
  Since: 2.0
  Example:
       -> { "execute": "object-del", "arguments": { "id": "rng1" } }
       <- { "return": {} }
Device infrastructure (qdev)
  device-list-properties (Command) List properties associated with a device.
  Arguments:
  "typename: string"
    the type name of a device
  Returns: a list of ObjectPropertyInfo describing a devices properties
  Note: objects can create properties at runtime, for example to describe links
  between different devices and/or objects. These properties are not included in the
  output of this command.
  Since: 1.2
  device_add (Command)
  Arguments:
  "driver: string"
    the name of the new device's driver
  "bus: string" (optional)
```

the device's parent bus (device tree path)

"id: string" (optional)

the device's ID, must be unique

Additional arguments depend on the type.

Add a device.

Notes:

- For detailed information about this command, please refer to the 'docs/qdev-device-use.txt' file.
- 2. It's possible to list device properties by running QEMU with the "-device DEVICE,help" command-line argument, where DEVICE is the device's name Example:

TODO: This command effectively bypasses QAPI completely due to its "additional arguments" business. It shouldn't have been added to the schema in this form. It should be gapified properly, or replaced by a properly gapified command.

Since: 0.13

device\_del (Command) Remove a device from a guest

Arguments:

"id: string"

the device's ID or QOM path

Returns: Nothing on success If "id" is not a valid device, DeviceNotFound

Notes: When this command completes, the device may not be removed from the guest.

Hot removal is an operation that requires guest cooperation. This command merely requests that the guest begin the hot removal process. Completion of the device removal process is signaled with a DEVICE\_DELETED event. Guest reset will automatically complete removal for all devices.

Since: 0.14.0

Example:

```
-> { "execute": "device_del",
```

```
"arguments": { "id": "net1" } }
       <- { "return": {} }
       -> { "execute": "device_del",
          "arguments": { "id": "/machine/peripheral-anon/device[0]" } }
       <- { "return": {} }
  DEVICE_DELETED (Event) Emitted whenever the device removal completion is
  acknowledged by the guest. At this point, it's safe to reuse the specified device
  ID. Device removal can be initiated by the guest or by HMP/QMP commands.
  Arguments:
  "device: string" (optional)
    device name
  "path: string"
    device path
  Since: 1.5
  Example:
       <- { "event": "DEVICE_DELETED",
          "data": { "device": "virtio-net-pci-0",
                "path": "/machine/peripheral/virtio-net-pci-0" },
          "timestamp": { "seconds": 1265044230, "microseconds": 450486 } }
Machines
  SysEmuTarget (Enum)
  The comprehensive enumeration of QEMU system emulation ("softmmu") targets. Run
  "./configure --help" in the project root directory, and look for the *-softmmu
  targets near the "--target-list" option. The individual target constants are not
  documented here, for the time being.
  Values:
  "aarch64"
    Not documented
  "alpha"
    Not documented
  "arm"
    Not documented
```

Notes: The resulting QMP strings can be appended to the "qemu-system-" prefix to
produce the corresponding QEMU executable name. This is true even for
"qemu-system-x86_64".
ppcemb: dropped in 3.1
Since: 3.0
CpuInfoArch (Enum)
An enumeration of cpu types that enable additional information during "query-cpus"
and "query-cpus-fast".
Values:
"s390"
```

since 2.12 Page 263/325

```
"riscv"

Since: 2.6
CpuInfo (Object)
Information about a virtual CPU
Members:
"CPU: int"
  the index of the virtual CPU
"current: boolean"
  this only exists for backwards compatibility and should be ignored
"halted: boolean"
  true if the virtual CPU is in the halt state. Halt usually refers to a
  processor specific low power mode.
"qom_path: string"
  path to the CPU object in the QOM tree (since 2.4)
"thread_id: int"
  ID of the underlying host thread
"props: CpuInstanceProperties" (optional)
  properties describing to which node/socket/core/thread virtual CPU belongs to,
  provided if supported by board (since 2.10)
```

"arch: CpuInfoArch" Page 264/325

```
listed (since 2.6)
The members of "CpuInfoX86" when "arch" is "x86"
The members of "CpuInfoSPARC" when "arch" is "sparc"
The members of "CpuInfoPPC" when "arch" is "ppc"
The members of "CpuInfoMIPS" when "arch" is "mips"
The members of "CpuInfoTricore" when "arch" is "tricore"
The members of "CpuInfoS390" when "arch" is "s390"
The members of "CpuInfoRISCV" when "arch" is "riscv"
Since: 0.14.0
Notes: "halted" is a transient state that changes frequently. By the time the data
is sent to the client, the guest may no longer be halted.
CpuInfoX86 (Object)
Additional information about a virtual i386 or x86_64 CPU
Members:
"pc: int"
  the 64-bit instruction pointer
Since: 2.6
CpuInfoSPARC (Object)
Additional information about a virtual SPARC CPU
Members:
"pc: int"
  the PC component of the instruction pointer
"npc: int"
  the NPC component of the instruction pointer
Since: 2.6
CpuInfoPPC (Object)
Additional information about a virtual PPC CPU
Members:
"nip: int"
  the instruction pointer
```

Since: 2.6

architecture of the cpu, which determines which additional fields will be

CpuInfoMIPS (Object) Page 265/325

Additional information about a virtual MIPS CPU
Members:
"PC: int"
the instruction pointer
Since: 2.6
CpuInfoTricore (Object)
Additional information about a virtual Tricore CPU
Members:
"PC: int"
the instruction pointer
Since: 2.6
CpuInfoRISCV (Object)
Additional information about a virtual RISCV CPU
Members:
"pc: int"
the instruction pointer
Since 2.12
CpuS390State (Enum)
An enumeration of cpu states that can be assumed by a virtual S390 CPU
Values:
"uninitialized"
Not documented
"stopped"
Not documented
"check-stop"
Not documented
"operating"
Not documented
"load"
Not documented
Since: 2.12

CpulnfoS390 (Object)

Additional information about a virtual S390 CPU

```
Members:
"cpu-state: CpuS390State"
  the virtual CPU's state
Since: 2.12
query-cpus (Command) Returns a list of information about each virtual CPU.
This command causes vCPU threads to exit to userspace, which causes a small
interruption to guest CPU execution. This will have a negative impact on realtime
guests and other latency sensitive guest workloads. It is recommended to use
"guery-cpus-fast" instead of this command to avoid the vCPU interruption.
Returns: a list of "CpuInfo" for each virtual CPU
Since: 0.14.0
Example:
    -> { "execute": "query-cpus" }
     <- { "return": [
            "CPU":0,
            "current":true,
            "halted":false.
            "qom_path":"/machine/unattached/device[0]",
            "arch":"x86",
            "pc":3227107138,
            "thread_id":3134
          },
          {
            "CPU":1,
            "current":false,
            "halted":true,
            "qom_path":"/machine/unattached/device[2]",
            "arch":"x86",
            "pc":7108165,
            "thread_id":3135
          }
```

1

```
}
Notes: This interface is deprecated (since 2.12.0), and it is strongly recommended
that you avoid using it. Use "query-cpus-fast" to obtain information about virtual
CPUs.
CpuInfoFast (Object)
Information about a virtual CPU
Members:
"cpu-index: int"
  index of the virtual CPU
"gom-path: string"
  path to the CPU object in the QOM tree
"thread-id: int"
  ID of the underlying host thread
"props: CpuInstanceProperties" (optional)
  properties describing to which node/socket/core/thread virtual CPU belongs to,
  provided if supported by board
"arch: CpuInfoArch"
  base architecture of the cpu; deprecated since 3.0.0 in favor of "target"
"target: SysEmuTarget"
  the QEMU system emulation target, which determines which additional fields will
  be listed (since 3.0)
The members of "CpuInfoS390" when "target" is "s390x"
Since: 2.12
query-cpus-fast (Command) Returns information about all virtual CPUs. This command
does not incur a performance penalty and should be used in production instead of
query-cpus.
Returns: list of "CpuInfoFast"
Since: 2.12
Example:
    -> { "execute": "query-cpus-fast" }
     <- { "return": [
          {
            "thread-id": 25627,
```

```
"core-id": 0,
               "thread-id": 0,
               "socket-id": 0
            },
            "qom-path": "/machine/unattached/device[0]",
            "arch": "x86",
            "target": "x86_64",
            "cpu-index": 0
         },
         {
            "thread-id": 25628,
            "props": {
               "core-id": 0,
               "thread-id": 0,
               "socket-id": 1
            },
            "qom-path": "/machine/unattached/device[2]",
            "arch": "x86",
            "target": "x86_64",
            "cpu-index": 1
         }
    }
cpu-add (Command) Adds CPU with specified ID.
Arguments:
"id: int"
  ID of CPU to be created, valid values [0..max_cpus)
Returns: Nothing on success
Since: 1.5
Note: This command is deprecated. The `device_add` command should be used instead.
See the `query-hotpluggable-cpus` command for details.
```

"props": {

Example: Page 269/325

```
-> { "execute": "cpu-add", "arguments": { "id": 2 } }
     <- { "return": {} }
MachineInfo (Object)
Information describing a machine.
Members:
"name: string"
  the name of the machine
"alias: string" (optional)
  an alias for the machine name
"is-default: boolean" (optional)
  whether the machine is default
"cpu-max: int"
  maximum number of CPUs supported by the machine type (since 1.5.0)
"hotpluggable-cpus: boolean"
  cpu hotplug via -device is supported (since 2.7.0)
"numa-mem-supported: boolean"
  true if '-numa node,mem' option is supported by the machine type and false
  otherwise (since 4.1)
"deprecated: boolean"
  if true, the machine type is deprecated and may be removed in future versions
  of QEMU according to the QEMU deprecation policy (since 4.1.0)
"default-cpu-type: string" (optional)
  default CPU model typename if none is requested via the -cpu argument. (since
  4.2)
Since: 1.2.0
query-machines (Command) Return a list of supported machines
Returns: a list of MachineInfo
Since: 1.2.0
CurrentMachineParams (Object)
Information describing the running machine parameters.
Members:
"wakeup-suspend-support: boolean"
  true if the machine supports wake up from suspend
```

Since: 4.0 query-current-machine (Command) Return information on the current virtual machine. Returns: CurrentMachineParams Since: 4.0 TargetInfo (Object) Information describing the QEMU target. Members: "arch: SysEmuTarget" the target architecture Since: 1.2.0 query-target (Command) Return information about the target for this QEMU Returns: TargetInfo Since: 1.2.0 NumaOptionsType (Enum) Values: "node" NUMA nodes configuration "dist" NUMA distance configuration (since 2.10) "cpu" property based CPU(s) to node mapping (Since: 2.10) Since: 2.1 NumaOptions (Object) A discriminated record of NUMA options. (for OptsVisitor) Members: "type: NumaOptionsType" Not documented The members of "NumaNodeOptions" when "type" is "node" The members of "NumaDistOptions" when "type" is "dist" The members of "NumaCpuOptions" when "type" is "cpu"

Page 271/325

NumaNodeOptions (Object)

Since: 2.1

```
Members:
"nodeid: int" (optional)
  NUMA node ID (increase by 1 from 0 if omitted)
"cpus: array of int" (optional)
  VCPUs belonging to this node (assign VCPUS round-robin if omitted)
"mem: int" (optional)
  memory size of this node; mutually exclusive with "memdev". Equally divide
  total memory among nodes if both "mem" and "memdev" are omitted.
"memdev: string" (optional)
  memory backend object. If specified for one node, it must be specified for all
  nodes.
Since: 2.1
NumaDistOptions (Object)
Set the distance between 2 NUMA nodes.
Members:
"src: int"
  source NUMA node.
"dst: int"
  destination NUMA node.
"val: int"
  NUMA distance from source node to destination node. When a node is unreachable
  from another node, set the distance between them to 255.
Since: 2.10
X86CPURegister32 (Enum)
A X86 32-bit register
Values:
"EAX"
  Not documented
"EBX"
  Not documented
"ECX"
  Not documented
```

"EDX"

Page 272/325

Not documented "ESP" Not documented "EBP" Not documented "ESI" Not documented "EDI" Not documented Since: 1.5 X86CPUFeatureWordInfo (Object) Information about a X86 CPU feature word Members: "cpuid-input-eax: int" Input EAX value for CPUID instruction for that feature word "cpuid-input-ecx: int" (optional) Input ECX value for CPUID instruction for that feature word "cpuid-register: X86CPURegister32" Output register containing the feature bits "features: int" value of output register, containing the feature bits Since: 1.5 DummyForceArrays (Object) Not used by QMP; hack to let us use X86CPUFeatureWordInfoList internally Members: "unused: array of X86CPUFeatureWordInfo" Not documented Since: 2.5 NumaCpuOptions (Object) Option "-numa cpu" overrides default cpu to node mapping. It accepts the same set of cpu properties as returned by query-hotpluggable-cpus[].props, where node-id

could be used to override default node mapping.

Members: Page 273/325

```
The members of "CpuInstanceProperties"
Since: 2.10
HostMemPolicy (Enum)
Host memory policy types
Values:
"default"
  restore default policy, remove any nondefault policy
"preferred"
  set the preferred host nodes for allocation
"bind"
  a strict policy that restricts memory allocation to the host nodes specified
"interleave"
  memory allocations are interleaved across the set of host nodes specified
Since: 2.1
Memdev (Object)
Information about memory backend
Members:
"id: string" (optional)
  backend's ID if backend has 'id' property (since 2.9)
"size: int"
  memory backend size
"merge: boolean"
  enables or disables memory merge support
"dump: boolean"
  includes memory backend's memory in a core dump or not
"prealloc: boolean"
  enables or disables memory preallocation
"host-nodes: array of int"
  host nodes for its memory policy
"policy: HostMemPolicy"
  memory policy of memory backend
Since: 2.1
```

query-memdev (Command) Returns information for all memory backends.

```
Returns: a list of "Memdev".
Since: 2.1
Example:
    -> { "execute": "query-memdev" }
     <- { "return": [
         {
          "id": "mem1",
          "size": 536870912,
          "merge": false,
          "dump": true,
          "prealloc": false,
          "host-nodes": [0, 1],
          "policy": "bind"
         },
          "size": 536870912,
          "merge": false,
          "dump": true,
          "prealloc": true,
          "host-nodes": [2, 3],
          "policy": "preferred"
         }
        ]
      }
CpuInstanceProperties (Object)
List of properties to be used for hotplugging a CPU instance, it should be passed
by management with device_add command when a CPU is being hotplugged.
Members:
"node-id: int" (optional)
  NUMA node ID the CPU belongs to
"socket-id: int" (optional)
  socket number within node/board the CPU belongs to
```

"die-id: int" (optional)

Page 275/325

```
die number within node/board the CPU belongs to (Since 4.1)
"core-id: int" (optional)
  core number within die the CPU belongs to# "thread-id": thread number within
  core the CPU belongs to
"thread-id: int" (optional)
  Not documented
Note: currently there are 5 properties that could be present but management should
be prepared to pass through other properties with device_add command to allow for
future interface extension. This also requires the filed names to be kept in sync
with the properties passed to -device/device add.
Since: 2.7
HotpluggableCPU (Object)
Members:
"type: string"
  CPU object type for usage with device_add command
"props: CpuInstanceProperties"
  list of properties to be used for hotplugging CPU
"vcpus-count: int"
  number of logical VCPU threads "HotpluggableCPU" provides
"gom-path: string" (optional)
  link to existing CPU object if CPU is present or omitted if CPU is not present.
Since: 2.7
query-hotpluggable-cpus (Command)
TODO: Better documentation; currently there is none.
Returns: a list of HotpluggableCPU objects.
Since: 2.7
Example:
     For pseries machine type started with -smp 2,cores=2,maxcpus=4 -cpu POWER8:
     -> { "execute": "query-hotpluggable-cpus" }
     <- {"return": [
        { "props": { "core": 8 }, "type": "POWER8-spapr-cpu-core",
         "vcpus-count": 1 },
```

{ "props": { "core": 0 }, "type": "POWER8-spapr-cpu-core",

```
"vcpus-count": 1, "gom-path": "/machine/unattached/device[0]"}
 ]}'
For pc machine type started with -smp 1,maxcpus=2:
-> { "execute": "query-hotpluggable-cpus" }
<- {"return": [
  {
     "type": "qemu64-x86_64-cpu", "vcpus-count": 1,
     "props": {"core-id": 0, "socket-id": 1, "thread-id": 0}
  },
   {
     "qom-path": "/machine/unattached/device[0]",
     "type": "qemu64-x86_64-cpu", "vcpus-count": 1,
     "props": {"core-id": 0, "socket-id": 0, "thread-id": 0}
  }
 ]}
For s390x-virtio-ccw machine type started with -smp 1,maxcpus=2 -cpu qemu
(Since: 2.11):
-> { "execute": "query-hotpluggable-cpus" }
<- {"return": [
  {
     "type": "gemu-s390x-cpu", "vcpus-count": 1,
     "props": { "core-id": 1 }
  },
   {
     "qom-path": "/machine/unattached/device[0]",
     "type": "qemu-s390x-cpu", "vcpus-count": 1,
     "props": { "core-id": 0 }
  }
 ]}
```

set-numa-node (Command) Runtime equivalent of '-numa' CLI option, available at preconfigure stage to configure numa mapping before initializing machine.

Since 3.0

CpuModelInfo (Object)

Virtual CPU model.

A CPU model consists of the name of a CPU definition, to which delta changes are applied (e.g. features added/removed). Most magic values that an architecture might require should be hidden behind the name. However, if required, architectures can expose relevant properties.

Members:

"name: string"

the name of the CPU definition the model is based on

"props: value" (optional)

a dictionary of QOM properties to be applied

Since: 2.8.0

CpuModelExpansionType (Enum)

An enumeration of CPU model expansion types.

Values:

"static"

Expand to a static CPU model, a combination of a static base model name and property delta changes. As the static base model will never change, the expanded CPU model will be the same, independent of QEMU version, machine type, machine options, and accelerator options. Therefore, the resulting model can be used by tooling without having to specify a compatibility machine - e.g. when displaying the "host" model. The "static" CPU models are migration-safe.

"full"

Expand all properties. The produced model is not guaranteed to be migrationsafe, but allows tooling to get an insight and work with model details.

Note: When a non-migration-safe CPU model is expanded in static mode, some features enabled by the CPU model may be omitted, because they can't be implemented by a static CPU model definition (e.g. cache info passthrough and PMU passthrough in x86). If you need an accurate representation of the features enabled by a nonmigration-safe CPU model, use "full". If you need a static representation that will keep ABI compatibility even when changing QEMU version or machine-type, use "static" (but keep in mind that some features may be omitted).

Page 278/325 Since: 2.8.0

CpuModelCompareResult (Enum)

An enumeration of CPU model comparison results. The result is usually calculated using e.g. CPU features or CPU generations.

Values:

"incompatible"

If model A is incompatible to model B, model A is not guaranteed to run where model B runs and the other way around.

"identical"

If model A is identical to model B, model A is guaranteed to run where model B runs and the other way around.

"superset"

If model A is a superset of model B, model B is guaranteed to run where model A runs. There are no guarantees about the other way.

"subset"

If model A is a subset of model B, model A is guaranteed to run where model B runs. There are no guarantees about the other way.

Since: 2.8.0

CpuModelBaselineInfo (Object)

The result of a CPU model baseline.

Members:

"model: CpuModelInfo"

the baselined CpuModelInfo.

Since: 2.8.0

If: "defined(TARGET\_S390X)"

CpuModelCompareInfo (Object)

The result of a CPU model comparison.

Members:

"result: CpuModelCompareResult"

The result of the compare operation.

"responsible-properties: array of string"

List of properties that led to the comparison result not being identical.

"responsible-properties" is a list of QOM property names that led to both CPUs not

being detected as identical. For identical models, this list is empty. If a QOM

property is read-only, that means there's no known way to make the CPU models identical. If the special property name "type" is included, the models are by definition not identical and cannot be made identical.

Since: 2.8.0

If: "defined(TARGET S390X)"

query-cpu-model-comparison (Command) Compares two CPU models, returning how they compare in a specific configuration. The results indicates how both models compare regarding runnability. This result can be used by tooling to make decisions if a certain CPU model will run in a certain configuration or if a compatible CPU model has to be created by baselining.

Usually, a CPU model is compared against the maximum possible CPU model of a certain configuration (e.g. the "host" model for KVM). If that CPU model is identical or a subset, it will run in that configuration.

The result returned by this command may be affected by:

- ? QEMU version: CPU models may look different depending on the QEMU version.
  (Except for CPU models reported as "static" in query-cpu-definitions.)
- ? machine-type: CPU model may look different depending on the machine-type.

  (Except for CPU models reported as "static" in query-cpu-definitions.)
- ? machine options (including accelerator): in some architectures, CPU models may look different depending on machine and accelerator options. (Except for CPU models reported as "static" in query-cpu-definitions.)
- ? "-cpu" arguments and global properties: arguments to the -cpu option and global properties may affect expansion of CPU models. Using query-cpu-model-expansion while using these is not advised.

Some architectures may not support comparing CPU models. s390x supports comparing CPU models.

Arguments:

"modela: CpuModelInfo"

Not documented

"modelb: CpuModelInfo"

Not documented

Returns: a CpuModelBaselineInfo. Returns an error if comparing CPU models is not supported, if a model cannot be used, if a model contains an unknown cpu definition

name, unknown properties or properties with wrong types.

Note: this command isn't specific to s390x, but is only implemented on this

architecture currently.

Since: 2.8.0

If: "defined(TARGET\_S390X)"

query-cpu-model-baseline (Command) Baseline two CPU models, creating a compatible

third model. The created model will always be a static, migration-safe CPU model

(see "static" CPU model expansion for details).

This interface can be used by tooling to create a compatible CPU model out two CPU

models. The created CPU model will be identical to or a subset of both CPU models

when comparing them. Therefore, the created CPU model is guaranteed to run where

the given CPU models run.

The result returned by this command may be affected by:

? QEMU version: CPU models may look different depending on the QEMU version.

(Except for CPU models reported as "static" in query-cpu-definitions.)

? machine-type: CPU model may look different depending on the machine-type.

(Except for CPU models reported as "static" in query-cpu-definitions.)

? machine options (including accelerator): in some architectures, CPU models may

look different depending on machine and accelerator options. (Except for CPU

models reported as "static" in query-cpu-definitions.)

? "-cpu" arguments and global properties: arguments to the -cpu option and global

properties may affect expansion of CPU models. Using query-cpu-model-expansion

while using these is not advised.

Some architectures may not support baselining CPU models. s390x supports baselining

CPU models.

Arguments:

"modela: CpuModelInfo"

Not documented

"modelb: CpuModelInfo"

Not documented

Returns: a CpuModelBaselineInfo. Returns an error if baselining CPU models is not

supported, if a model cannot be used, if a model contains an unknown cpu definition

name, unknown properties or properties with wrong types.

Page 281/325

Note: this command isn't specific to s390x, but is only implemented on this architecture currently.

Since: 2.8.0

If: "defined(TARGET\_S390X)"

CpuModelExpansionInfo (Object)

The result of a cpu model expansion.

Members:

"model: CpuModelInfo"

the expanded CpuModelInfo.

Since: 2.8.0

If: "defined(TARGET\_S390X) || defined(TARGET\_I386) || defined(TARGET\_ARM)" query-cpu-model-expansion (Command) Expands a given CPU model (or a combination of CPU model + additional options) to different granularities, allowing tooling to get an understanding what a specific CPU model looks like in QEMU under a certain configuration.

This interface can be used to query the "host" CPU model.

The data returned by this command may be affected by:

? QEMU version: CPU models may look different depending on the QEMU version.
(Except for CPU models reported as "static" in query-cpu-definitions.)

? machine-type: CPU model may look different depending on the machine-type.

(Except for CPU models reported as "static" in query-cpu-definitions.)

- ? machine options (including accelerator): in some architectures, CPU models may look different depending on machine and accelerator options. (Except for CPU models reported as "static" in query-cpu-definitions.)
- ? "-cpu" arguments and global properties: arguments to the -cpu option and global properties may affect expansion of CPU models. Using query-cpu-model-expansion while using these is not advised.

Some architectures may not support all expansion types. s390x supports "full" and "static". Arm only supports "full".

Arguments:

"type: CpuModelExpansionType"

Not documented

"model: CpuModelInfo" Page 282/325

Not documented

Returns: a CpuModelExpansionInfo. Returns an error if expanding CPU models is not supported, if the model cannot be expanded, if the model contains an unknown CPU definition name, unknown properties or properties with a wrong type. Also returns an error if an expansion type is not supported.

Since: 2.8.0

If: "defined(TARGET\_S390X) || defined(TARGET\_I386) || defined(TARGET\_ARM)"

CpuDefinitionInfo (Object)

Virtual CPU definition.

Members:

"name: string"

the name of the CPU definition

"migration-safe: boolean" (optional)

whether a CPU definition can be safely used for migration in combination with a QEMU compatibility machine when migrating between different QEMU versions and between hosts with different sets of (hardware or software) capabilities. If not provided, information is not available and callers should not assume the CPU definition to be migration-safe. (since 2.8)

"static: boolean"

whether a CPU definition is static and will not change depending on QEMU version, machine type, machine options and accelerator options. A static model is always migration-safe. (since 2.8)

"unavailable-features: array of string" (optional)

List of properties that prevent the CPU model from running in the current host. (since 2.8)

"typename: string"

Type name that can be used as argument to "device-list-properties", to introspect properties configurable using -cpu or -global. (since 2.9)

"alias-of: string" (optional)

Name of CPU model this model is an alias for. The target of the CPU model alias may change depending on the machine type. Management software is supposed to translate CPU model aliases in the VM configuration, because aliases may stop being migration-safe in the future (since 4.1)

"unavailable-features" is a list of QOM property names that represent CPU model attributes that prevent the CPU from running. If the QOM property is read-only, that means there's no known way to make the CPU model run in the current host. Implementations that choose not to provide specific information return the property name "type". If the property is read-write, it means that it MAY be possible to run the CPU model in the current host if that property is changed. Management software can use it as hints to suggest or choose an alternative for the user, or just to generate meaningful error messages explaining why the CPU model can't be used. If "unavailable-features" is an empty list, the CPU model is runnable using the current host and machine-type. If "unavailable-features" is not present, runnability information for the CPU is not available.

Since: 1.2.0

If: "defined(TARGET\_PPC) || defined(TARGET\_ARM) || defined(TARGET\_I386) || defined(TARGET\_S390X) || defined(TARGET\_MIPS)"

query-cpu-definitions (Command) Return a list of supported virtual CPU definitions

Returns: a list of CpuDefInfo

Since: 1.2.0

If: "defined(TARGET\_PPC) || defined(TARGET\_ARM) || defined(TARGET\_I386) || defined(TARGET\_S390X) || defined(TARGET\_MIPS)"

## Miscellanea

qmp\_capabilities (Command) Enable QMP capabilities.

Arguments:

Arguments:

"enable: array of QMPCapability" (optional)

An optional list of QMPCapability values to enable. The client must not enable any capability that is not mentioned in the QMP greeting message. If the field is not provided, it means no QMP capabilities will be enabled. (since 2.12)

## Example:

Notes: This command is valid exactly when first connecting: it must be issued before any other command will be accepted, and will fail once the monitor is

accepting other commands. (see qemu docs/interop/qmp-spec.txt)

The QMP client needs to explicitly enable QMP capabilities, otherwise all the QMP capabilities will be turned off by default.

Since: 0.13

QMPCapability (Enum)

Enumeration of capabilities to be advertised during initial client connection, used for agreeing on particular QMP extension behaviors.

Values:

"oob"

QMP ability to support out-of-band requests. (Please refer to qmp-spec.txt for more information on OOB)

Since: 2.12

VersionTriple (Object)

A three-part version number.

Members:

"major: int"

The major version number.

"minor: int"

The minor version number.

"micro: int"

The micro version number.

Since: 2.4

VersionInfo (Object)

A description of QEMU's version.

Members:

"gemu: VersionTriple"

The version of QEMU. By current convention, a micro version of 50 signifies a development branch. A micro version greater than or equal to 90 signifies a release candidate for the next minor version. A micro version of less than 50 signifies a stable release.

"package: string"

QEMU will always set this field to an empty string. Downstream versions of QEMU should set this to a non-empty string. The exact format depends on the

downstream however it highly recommended that a unique name is used. Since: 0.14.0 query-version (Command) Returns the current version of QEMU. Returns: A "VersionInfo" object describing the current version of QEMU. Since: 0.14.0 Example: -> { "execute": "query-version" } <- { "return":{ "qemu":{ "major":0, "minor":11, "micro":5 }, "package":"" } } CommandInfo (Object) Information about a QMP command Members: "name: string" The command name Since: 0.14.0 query-commands (Command) Return a list of supported QMP commands by this server Returns: A list of "CommandInfo" for all supported commands Since: 0.14.0 Example: -> { "execute": "query-commands" } <- { "return":[

{

},

"name":"query-balloon"

Page 286/325

```
"name":"system powerdown"
         }
        1
      }
Note: This example has been shortened as the real response is too long.
LostTickPolicy (Enum)
Policy for handling lost ticks in timer devices.
Values:
"discard"
  throw away the missed tick(s) and continue with future injection normally.
  Guest time may be delayed, unless the OS has explicit handling of lost ticks
"delay"
  continue to deliver ticks at the normal rate. Guest time will be delayed due
  to the late tick
"slew"
  deliver ticks at a higher rate to catch up with the missed tick. The guest time
  should not be delayed once catchup is complete.
Since: 2.0
add_client (Command) Allow client connections for VNC, Spice and socket based
character devices to be passed in to QEMU via SCM_RIGHTS.
Arguments:
"protocol: string"
  protocol name. Valid names are "vnc", "spice" or the name of a character device
  (eg. from -chardev id=XXXX)
"fdname: string"
  file descriptor name previously passed via 'getfd' command
"skipauth: boolean" (optional)
  whether to skip authentication. Only applies to "vnc" and "spice" protocols
"tls: boolean" (optional)
  whether to perform TLS. Only applies to the "spice" protocol
Returns: nothing on success.
```

Since: 0.14.0 Page 287/325

```
-> { "execute": "add_client", "arguments": { "protocol": "vnc",
                                 "fdname": "myclient" } }
    <- { "return": {} }
NameInfo (Object)
Guest name information.
Members:
"name: string" (optional)
  The name of the guest
Since: 0.14.0
query-name (Command) Return the name information of a guest.
Returns: "NameInfo" of the guest
Since: 0.14.0
Example:
    -> { "execute": "query-name" }
     <- { "return": { "name": "qemu-name" } }
KvmInfo (Object)
Information about support for KVM acceleration
Members:
"enabled: boolean"
  true if KVM acceleration is active
"present: boolean"
  true if KVM acceleration is built into this executable
Since: 0.14.0
query-kvm (Command) Returns information about KVM acceleration
Returns: "KvmInfo"
Since: 0.14.0
Example:
    -> { "execute": "query-kvm" }
     <- { "return": { "enabled": true, "present": true } }
UuidInfo (Object)
Guest UUID information (Universally Unique Identifier).
```

Example:

Members: Page 288/325

```
"UUID: string"
  the UUID of the guest
Since: 0.14.0
Notes: If no UUID was specified for the guest, a null UUID is returned.
query-uuid (Command) Query the guest UUID information.
Returns: The "UuidInfo" for the guest
Since: 0.14.0
Example:
    -> { "execute": "query-uuid" }
    <- { "return": { "UUID": "550e8400-e29b-41d4-a716-446655440000" } }
EventInfo (Object)
Information about a QMP event
Members:
"name: string"
  The event name
Since: 1.2.0
query-events (Command) Return information on QMP events.
Returns: A list of "EventInfo".
Since: 1.2.0
Note: This command is deprecated, because its output doesn't reflect compile-time
configuration. Use query-qmp-schema instead.
Example:
    -> { "execute": "query-events" }
    <- {
       "return": [
            "name": "SHUTDOWN"
          },
          {
            "name":"RESET"
          }
        ]
```

```
Note: This example has been shortened as the real response is too long.
IOThreadInfo (Object)
Information about an iothread
Members:
"id: string"
  the identifier of the iothread
"thread-id: int"
  ID of the underlying host thread
"poll-max-ns: int"
  maximum polling time in ns, 0 means polling is disabled (since 2.9)
"poll-grow: int"
  how many ns will be added to polling time, 0 means that it's not configured
  (since 2.9)
"poll-shrink: int"
  how many ns will be removed from polling time, 0 means that it's not configured
  (since 2.9)
Since: 2.0
query-iothreads (Command) Returns a list of information about each iothread.
Note: this list excludes the QEMU main loop thread, which is not declared using the
-object iothread command-line option. It is always the main thread of the process.
Returns: a list of "IOThreadInfo" for each iothread
Since: 2.0
Example:
     -> { "execute": "query-iothreads" }
     <- { "return": [
             "id":"iothread0",
             "thread-id":3134
          },
             "id": "iothread1",
             "thread-id":3135
```

```
]
BalloonInfo (Object)
Information about the guest balloon device.
Members:
"actual: int"
  the number of bytes the balloon currently contains
Since: 0.14.0
query-balloon (Command) Return information about the balloon device.
Returns: "BalloonInfo" on success
If the balloon driver is enabled but not functional because the KVM kernel module
cannot support it, KvmMissingCap
If no balloon device is present, DeviceNotActive
Since: 0.14.0
Example:
    -> { "execute": "query-balloon" }
     <- { "return": {
          "actual": 1073741824,
        }
      }
BALLOON_CHANGE (Event) Emitted when the guest changes the actual BALLOON level.
This value is equivalent to the "actual" field return by the 'query-balloon'
command
Arguments:
"actual: int"
  actual level of the guest memory balloon in bytes
Note: this event is rate-limited.
Since: 1.2
Example:
     <- { "event": "BALLOON_CHANGE",
        "data": { "actual": 944766976 },
        "timestamp": { "seconds": 1267020223, "microseconds": 435656 } }
```

```
A PCI device memory region
Members:
"base: int"
  the starting address (guest physical)
"limit: int"
  the ending address (guest physical)
Since: 0.14.0
PciMemoryRegion (Object)
Information about a PCI device I/O region.
Members:
"bar: int"
  the index of the Base Address Register for this region
"type: string"
  'io' if the region is a PIO region 'memory' if the region is a MMIO region
"size: int"
  memory size
"prefetch: boolean" (optional)
  if "type" is 'memory', true if the memory is prefetchable
"mem_type_64: boolean" (optional)
  if "type" is 'memory', true if the BAR is 64-bit
"address: int"
  Not documented
Since: 0.14.0
PciBusInfo (Object)
Information about a bus of a PCI Bridge device
Members:
"number: int"
  primary bus interface number. This should be the number of the bus the device
  resides on.
"secondary: int"
  secondary bus interface number. This is the number of the main bus for the
  bridge
```

"subordinate: int"

Page 292/325

This is the highest number bus that resides below the bridge. "io\_range: PciMemoryRange" The PIO range for all devices on this bridge "memory\_range: PciMemoryRange" The MMIO range for all devices on this bridge "prefetchable\_range: PciMemoryRange" The range of prefetchable MMIO for all devices on this bridge Since: 2.4 PciBridgeInfo (Object) Information about a PCI Bridge device Members: "bus: PciBusInfo" information about the bus the device resides on "devices: array of PciDeviceInfo" (optional) a list of "PciDeviceInfo" for each device on this bridge Since: 0.14.0 PciDeviceClass (Object) Information about the Class of a PCI device Members: "desc: string" (optional) a string description of the device's class "class: int" the class code of the device Since: 2.4 PciDeviceId (Object) Information about the Id of a PCI device Members: "device: int" the PCI device id "vendor: int" the PCI vendor id "subsystem: int" (optional)

the PCI subsystem id (since 3.1)

"subsystem-vendor: int" (optional) the PCI subsystem vendor id (since 3.1) Since: 2.4 PciDeviceInfo (Object) Information about a PCI device Members: "bus: int" the bus number of the device "slot: int" the slot the device is located in "function: int" the function of the slot used by the device "class\_info: PciDeviceClass" the class of the device "id: PciDeviceId" the PCI device id "irq: int" (optional) if an IRQ is assigned to the device, the IRQ number "qdev\_id: string" the device name of the PCI device "pci\_bridge: PciBridgeInfo" (optional) if the device is a PCI bridge, the bridge information "regions: array of PciMemoryRegion" a list of the PCI I/O regions associated with the device Notes: the contents of "class\_info".desc are not stable and should only be treated as informational. Since: 0.14.0 PciInfo (Object) Information about a PCI bus Members: "bus: int" the bus index

"devices: array of PciDeviceInfo"

```
Since: 0.14.0
```

query-pci (Command) Return information about the PCI bus topology of the guest.

Returns: a list of "PciInfo" for each PCI bus. Each bus is represented by a jsonobject, which has a key with a json-array of all PCI devices attached to it. Each
device is represented by a json-object.

```
Since: 0.14.0
```

```
Example:
```

```
-> { "execute": "query-pci" }
<- { "return": [
      {
        "bus": 0,
        "devices": [
            "bus": 0,
            "qdev_id": "",
            "slot": 0,
            "class_info": {
              "class": 1536,
              "desc": "Host bridge"
            },
            "id": {
              "device": 32902,
              "vendor": 4663
            },

```

Note: This example has been shortened as the real response is too long.

quit (Command) This command will cause the QEMU process to exit gracefully. While every attempt is made to send the QMP response before terminating, this is not guaranteed. When using this interface, a premature EOF would not be unexpected.

Since: 0.14.0

# Example:

```
-> { "execute": "quit" }
<- { "return": {} }
```

stop (Command) Stop all guest VCPU execution.

Since: 0.14.0

Notes: This function will succeed even if the guest is already in the stopped state. In "inmigrate" state, it will ensure that the guest remains paused once migration finishes, as if the -S option was passed on the command line.

## Example:

```
-> { "execute": "stop" }
<- { "return": {} }
```

system\_reset (Command) Performs a hard reset of a guest.

Since: 0.14.0

### Example:

```
-> { "execute": "system_reset" }
<- { "return": {} }
```

system\_powerdown (Command) Requests that a guest perform a powerdown operation.

Since: 0.14.0

Notes: A guest may or may not respond to this command. This command returning does not indicate that a guest has accepted the request or that it has shut down. Many guests will respond to this command by prompting the user in some way.

### Example:

```
-> { "execute": "system_powerdown" } 
<- { "return": {} }
```

memsave (Command) Save a portion of guest memory to a file.

Arguments: Page 299/325

```
"val: int"
  the virtual address of the guest to start from
"size: int"
  the size of memory region to save
"filename: string"
  the file to save the memory to as binary data
"cpu-index: int" (optional)
  the index of the virtual CPU to use for translating the virtual address
  (defaults to CPU 0)
Returns: Nothing on success
Since: 0.14.0
Notes: Errors were not reliably returned until 1.1
Example:
     -> { "execute": "memsave",
        "arguments": { "val": 10,
                  "size": 100,
                  "filename": "/tmp/virtual-mem-dump" } }
     <- { "return": {} }
pmemsave (Command) Save a portion of guest physical memory to a file.
Arguments:
"val: int"
  the physical address of the guest to start from
"size: int"
  the size of memory region to save
"filename: string"
  the file to save the memory to as binary data
Returns: Nothing on success
Since: 0.14.0
Notes: Errors were not reliably returned until 1.1
Example:
     -> { "execute": "pmemsave",
        "arguments": { "val": 10,
```

"size": 100,

```
"filename": "/tmp/physical-mem-dump" } }
     <- { "return": {} }
cont (Command) Resume guest VCPU execution.
Since: 0.14.0
Returns: If successful, nothing
Notes: This command will succeed if the guest is currently running. It will also
succeed if the guest is in the "inmigrate" state; in this case, the effect of the
command is to make sure the guest starts once migration finishes, removing the
effect of the -S command line option if it was passed.
Example:
    -> { "execute": "cont" }
     <- { "return": {} }
x-exit-preconfig (Command) Exit from "preconfig" state
This command makes QEMU exit the preconfig state and proceed with VM initialization
using configuration data provided on the command line and via the QMP monitor
during the preconfig state. The command is only available during the preconfig
state (i.e. when the --preconfig command line option was in use).
Since 3.0
Returns: nothing
Example:
    -> { "execute": "x-exit-preconfig" }
     <- { "return": {} }
system_wakeup (Command) Wake up guest from suspend. If the guest has wake-up from
suspend support enabled (wakeup-suspend-support flag from query-current-machine),
wake-up guest from suspend if the guest is in SUSPENDED state. Return an error
otherwise.
Since: 1.1
Returns: nothing.
Note: prior to 4.0, this command does nothing in case the guest isn't suspended.
Example:
    -> { "execute": "system_wakeup" }
     <- { "return": {} }
```

(x86/s390) or all CPUs (ppc64). The command fails when the guest doesn't support injecting. Returns: If successful, nothing Since: 0.14.0 Note: prior to 2.1, this command was only supported for x86 and s390 VMs Example: -> { "execute": "inject-nmi" } <- { "return": {} } balloon (Command) Request the balloon driver to change its balloon size. Arguments: "value: int" the target size of the balloon in bytes Returns: Nothing on success If the balloon driver is enabled but not functional because the KVM kernel module cannot support it, KvmMissingCap If no balloon device is present, DeviceNotActive Notes: This command just issues a request to the guest. When it returns, the balloon size may not have changed. A guest can change the balloon size independent of this command. Since: 0.14.0 Example: -> { "execute": "balloon", "arguments": { "value": 536870912 } } <- { "return": {} } human-monitor-command (Command) Execute a command on the human monitor and return the output. Arguments: "command-line: string" the command to execute in the human monitor "cpu-index: int" (optional) The CPU to use for commands that require an implicit CPU Features: "savevm-monitor-nodes" If present, HMP command savevm only snapshots monitor-owned nodes if they have

no parents. This allows the use of 'savevm' with -blockdev. (since 4.2)

Page 302/325

Returns: the output of the command as a string

Since: 0.14.0

Notes: This command only exists as a stop-gap. Its use is highly discouraged. The semantics of this command are not guaranteed: this means that command names, arguments and responses can change or be removed at ANY time. Applications that rely on long term stability guarantees should NOT use this command.

Known limitations:

- ? This command is stateless, this means that commands that depend on state information (such as getfd) might not work
- ? Commands that prompt the user for data don't currently work

## Example:

change (Command) This command is multiple commands multiplexed together.

Arguments:

"device: string"

This is normally the name of a block device but it may also be 'vnc'. when it's 'vnc', then sub command depends on "target"

"target: string"

If "device" is a block device, then this is the new filename. If "device" is 'vnc', then if the value 'password' selects the vnc change password command.

Otherwise, this specifies a new server URI address to listen to for VNC

connections.

"arg: string" (optional)

If "device" is a block device, then this is an optional format to open the device with. If "device" is 'vnc' and "target" is 'password', this is the new VNC password to set. See change-vnc-password for additional notes.

Returns: Nothing on success. If "device" is not a valid block device,

#### DeviceNotFound

Notes: This interface is deprecated, and it is strongly recommended that you avoid using it. For changing block devices, use blockdev-change-medium; for changing VNC parameters, use change-vnc-password.

Since: 0.14.0

Example:

```
1. Change a removable medium
     -> { "execute": "change",
        "arguments": { "device": "ide1-cd0",
                  "target": "/srv/images/Fedora-12-x86_64-DVD.iso" } }
     <- { "return": {} }
     2. Change VNC password
     -> { "execute": "change",
        "arguments": { "device": "vnc", "target": "password",
                  "arg": "foobar1" } }
     <- { "return": {} }
xen-set-global-dirty-log (Command) Enable or disable the global dirty log mode.
Arguments:
"enable: boolean"
  true to enable, false to disable.
Returns: nothing
Since: 1.3
Example:
     -> { "execute": "xen-set-global-dirty-log",
        "arguments": { "enable": true } }
     <- { "return": {} }
getfd (Command) Receive a file descriptor via SCM rights and assign it a name
Arguments:
"fdname: string"
  file descriptor name
Returns: Nothing on success
Since: 0.14.0
Notes: If "fdname" already exists, the file descriptor assigned to it will be
closed and replaced by the received file descriptor.
The 'closefd' command can be used to explicitly close the file descriptor when it
is no longer needed.
```

Example: Page 304/325

```
-> { "execute": "getfd", "arguments": { "fdname": "fd1" } }
     <- { "return": {} }
closefd (Command) Close a file descriptor previously passed via SCM rights
Arguments:
"fdname: string"
  file descriptor name
Returns: Nothing on success
Since: 0.14.0
Example:
    -> { "execute": "closefd", "arguments": { "fdname": "fd1" } }
     <- { "return": {} }
MemoryInfo (Object)
Actual memory information in bytes.
Members:
"base-memory: int"
  size of "base" memory specified with command line option -m.
"plugged-memory: int" (optional)
  size of memory that can be hot-unplugged. This field is omitted if target
  doesn't support memory hotplug (i.e. CONFIG_MEM_DEVICE not defined at build
  time).
Since: 2.11.0
query-memory-size-summary (Command) Return the amount of initially allocated and
present hotpluggable (if enabled) memory in bytes.
Example:
     -> { "execute": "query-memory-size-summary" }
     <- { "return": { "base-memory": 4294967296, "plugged-memory": 0 } }
Since: 2.11.0
AddfdInfo (Object)
Information about a file descriptor that was added to an fd set.
Members:
"fdset-id: int"
  The ID of the fd set that "fd" was added to.
```

"fd: int" Page 305/325

The file descriptor that was received via SCM rights and added to the fd set. Since: 1.2.0 add-fd (Command) Add a file descriptor, that was passed via SCM rights, to an fd set. Arguments: "fdset-id: int" (optional) The ID of the fd set to add the file descriptor to. "opaque: string" (optional) A free-form string that can be used to describe the fd. Returns: "AddfdInfo" on success If file descriptor was not received, FdNotSupplied If "fdset-id" is a negative value, InvalidParameterValue Notes: The list of fd sets is shared by all monitor connections. If "fdset-id" is not specified, a new fd set will be created. Since: 1.2.0 Example: -> { "execute": "add-fd", "arguments": { "fdset-id": 1 } } <- { "return": { "fdset-id": 1, "fd": 3 } } remove-fd (Command) Remove a file descriptor from an fd set. Arguments: "fdset-id: int" The ID of the fd set that the file descriptor belongs to. "fd: int" (optional) The file descriptor that is to be removed. Returns: Nothing on success If "fdset-id" or "fd" is not found, FdNotFound Since: 1.2.0 Notes: The list of fd sets is shared by all monitor connections. If "fd" is not specified, all file descriptors in "fdset-id" will be removed. Example: -> { "execute": "remove-fd", "arguments": { "fdset-id": 1, "fd": 3 } } <- { "return": {} }

Page 306/325

FdsetFdInfo (Object)

```
Members:
"fd: int"
  The file descriptor value.
"opaque: string" (optional)
  A free-form string that can be used to describe the fd.
Since: 1.2.0
FdsetInfo (Object)
Information about an fd set.
Members:
"fdset-id: int"
  The ID of the fd set.
"fds: array of FdsetFdInfo"
  A list of file descriptors that belong to this fd set.
Since: 1.2.0
query-fdsets (Command) Return information describing all fd sets.
Returns: A list of "FdsetInfo"
Since: 1.2.0
Note: The list of fd sets is shared by all monitor connections.
Example:
     -> { "execute": "query-fdsets" }
     <- { "return": [
          {
           "fds": [
            {
              "fd": 30,
              "opaque": "rdonly:/path/to/file"
            },
              "fd": 24,
              "opaque": "rdwr:/path/to/file"
            }
           ],
```

"fdset-id": 1

Page 307/325

```
},
    "fds": [
      {
       "fd": 28
      },
       "fd": 29
      }
    ],
    "fdset-id": 0
   }
 ]
}
```

AcpiTableOptions (Object)

Specify an ACPI table on the command line to load.

At most one of "file" and "data" can be specified. The list of files specified by any one of them is loaded and concatenated in order. If both are omitted, "data" is implied.

Other fields / optargs can be used to override fields of the generic ACPI table header; refer to the ACPI specification 5.0, section 5.2.6 System Description Table Header. If a header field is not overridden, then the corresponding value from the concatenated blob is used (in case of "file"), or it is filled in with a hard-coded value (in case of "data").

String fields are copied into the matching ACPI member from lowest address upwards, and silently truncated / NUL-padded to length.

Members:

```
"sig: string" (optional)
  table signature / identifier (4 bytes)
"rev: int" (optional)
  table revision number (dependent on signature, 1 byte)
"oem_id: string" (optional)
  OEM identifier (6 bytes)
```

```
"oem table id: string" (optional)
  OEM table identifier (8 bytes)
"oem_rev: int" (optional)
  OEM-supplied revision number (4 bytes)
"asl_compiler_id: string" (optional)
  identifier of the utility that created the table (4 bytes)
"asl_compiler_rev: int" (optional)
  revision number of the utility that created the table (4 bytes)
"file: string" (optional)
  colon (:) separated list of pathnames to load and concatenate as table data.
  The resultant binary blob is expected to have an ACPI table header. At least
  one file is required. This field excludes "data".
"data: string" (optional)
  colon (:) separated list of pathnames to load and concatenate as table data.
  The resultant binary blob must not have an ACPI table header. At least one file
  is required. This field excludes "file".
Since: 1.5
CommandLineParameterType (Enum)
Possible types for an option parameter.
Values:
"string"
  accepts a character string
"boolean"
  accepts "on" or "off"
"number"
  accepts a number
"size"
  accepts a number followed by an optional suffix (K)ilo, (M)ega, (G)iga, (T)era
Since: 1.5
CommandLineParameterInfo (Object)
Details about a single parameter of a command line option.
Members:
```

"name: string"

Page 309/325

```
parameter name
"type: CommandLineParameterType"
  parameter "CommandLineParameterType"
"help: string" (optional)
  human readable text string, not suitable for parsing.
"default: string" (optional)
  default value string (since 2.1)
Since: 1.5
CommandLineOptionInfo (Object)
Details about a command line option, including its list of parameter details
Members:
"option: string"
  option name
"parameters: array of CommandLineParameterInfo"
  an array of "CommandLineParameterInfo"
Since: 1.5
query-command-line-options (Command) Query command line option schema.
Arguments:
"option: string" (optional)
  option name
Returns: list of "CommandLineOptionInfo" for all options (or for the given
"option"). Returns an error if the given "option" doesn't exist.
Since: 1.5
Example:
     -> { "execute": "query-command-line-options",
        "arguments": { "option": "option-rom" } }
     <- { "return": [
            "parameters": [
               {
                 "name": "romfile",
                 "type": "string"
```

},

```
"name": "bootindex",
                 "type": "number"
              }
            ],
            "option": "option-rom"
         }
       ]
PCDIMMDeviceInfo (Object)
PCDIMMDevice state information
Members:
"id: string" (optional)
  device's ID
"addr: int"
  physical address, where device is mapped
"size: int"
  size of memory that the device provides
"slot: int"
  slot number at which device is plugged in
"node: int"
  NUMA node number where device is plugged in
"memdev: string"
  memory backend linked with device
"hotplugged: boolean"
  true if device was hotplugged
"hotpluggable: boolean"
  true if device if could be added/removed while machine is running
Since: 2.1
VirtioPMEMDeviceInfo (Object)
VirtioPMEM state information
Members:
"id: string" (optional)
```

```
device's ID
"memaddr: int"
  physical address in memory, where device is mapped
"size: int"
  size of memory that the device provides
"memdev: string"
  memory backend linked with device
Since: 4.1
MemoryDeviceInfo (Object)
Union containing information about a memory device
nvdimm is included since 2.12. virtio-pmem is included since 4.1.
Members:
"type"
  One of "dimm", "nvdimm", "virtio-pmem"
"data: PCDIMMDeviceInfo" when "type" is "dimm"
"data: PCDIMMDeviceInfo" when "type" is "nvdimm"
"data: VirtioPMEMDeviceInfo" when "type" is "virtio-pmem"
Since: 2.1
query-memory-devices (Command) Lists available memory devices and their state
Since: 2.1
Example:
    -> { "execute": "query-memory-devices" }
     <- { "return": [ { "data":
                  { "addr": 5368709120,
                   "hotpluggable": true,
                   "hotplugged": true,
                   "id": "d1",
                   "memdev": "/objects/memX",
                   "node": 0,
                   "size": 1073741824,
                   "slot": 0},
                "type": "dimm"
```

} ] }

Page 312/325

```
MEM UNPLUG ERROR (Event) Emitted when memory hot unplug error occurs.
Arguments:
"device: string"
  device name
"msg: string"
  Informative message
Since: 2.4
Example:
     <- { "event": "MEM_UNPLUG_ERROR"
        "data": { "device": "dimm1",
              "msg": "acpi: device unplug for unsupported device"
       },
        "timestamp": { "seconds": 1265044230, "microseconds": 450486 } }
ACPISIotType (Enum)
Values:
"DIMM"
  memory slot
"CPU"
  logical CPU slot (since 2.7)
ACPIOSTInfo (Object)
OSPM Status Indication for a device For description of possible values of "source"
and "status" fields see "_OST (OSPM Status Indication)" chapter of ACPI5.0 spec.
Members:
"device: string" (optional)
  device ID associated with slot
"slot: string"
  slot ID, unique per slot of a given "slot-type"
"slot-type: ACPISlotType"
  type of the slot
"source: int"
  an integer containing the source event
"status: int"
  an integer containing the status code
```

```
Since: 2.1
query-acpi-ospm-status (Command) Return a list of ACPIOSTInfo for devices that
support status reporting via ACPI_OST method.
Since: 2.1
Example:
    -> { "execute": "query-acpi-ospm-status" }
     <- { "return": [ { "device": "d1", "slot": "0", "slot-type": "DIMM", "source": 1, "status": 0},
               { "slot": "1", "slot-type": "DIMM", "source": 0, "status": 0},
               { "slot": "2", "slot-type": "DIMM", "source": 0, "status": 0},
               { "slot": "3", "slot-type": "DIMM", "source": 0, "status": 0}
      ]}
ACPI_DEVICE_OST (Event) Emitted when guest executes ACPI_OST method.
Arguments:
"info: ACPIOSTInfo"
  OSPM Status Indication
Since: 2.1
Example:
     <- { "event": "ACPI DEVICE OST",
        "data": { "device": "d1", "slot": "0",
              "slot-type": "DIMM", "source": 1, "status": 0 } }
ReplayMode (Enum)
Mode of the replay subsystem.
Values:
"none"
  normal execution mode. Replay or record are not enabled.
"record"
  record mode. All non-deterministic data is written into the replay log.
"play"
  replay mode. Non-deterministic data required for system execution is read from
  the log.
Since: 2.5
xen-load-devices-state (Command) Load the state of all devices from file. The RAM
```

and the block devices of the VM are not loaded by this command.

```
Arguments:
"filename: string"
  the file to load the state of the devices from as binary data. See
  xen-save-devices-state.txt for a description of the binary format.
Since: 2.7
Example:
    -> { "execute": "xen-load-devices-state",
        "arguments": { "filename": "/tmp/resume" } }
    <- { "return": {} }
GuidInfo (Object)
GUID information.
Members:
"guid: string"
  the globally unique identifier
Since: 2.9
query-vm-generation-id (Command) Show Virtual Machine Generation ID
Since: 2.9
RTC CHANGE (Event) Emitted when the guest changes the RTC time.
Arguments:
"offset: int"
  offset between base RTC clock (as specified by -rtc base), and new RTC clock
  value
Note: This event is rate-limited.
Since: 0.13.0
Example:
    <- { "event": "RTC CHANGE",
         "data": { "offset": 78 },
         "timestamp": { "seconds": 1267020223, "microseconds": 435656 } }
If: "defined(TARGET_ALPHA) || defined(TARGET_ARM) || defined(TARGET_HPPA) ||
defined(TARGET_I386) || defined(TARGET_MIPS) || defined(TARGET_MIPS64) ||
defined(TARGET_MOXIE) || defined(TARGET_PPC) || defined(TARGET_PPC64) ||

```

rtc-reset-reinjection (Command) This command will reset the RTC interrupt

```
in effect, for example QEMU guest agent's guest-set-time command.
Since: 2.1
Example:
    -> { "execute": "rtc-reset-reinjection" }
     <- { "return": {} }
If: "defined(TARGET_I386)"
SevState (Enum)
An enumeration of SEV state information used during "query-sev".
Values:
"uninit"
  The guest is uninitialized.
"launch-update"
  The guest is currently being launched; plaintext data and register state is
  being imported.
"launch-secret"
  The guest is currently being launched; ciphertext data is being imported.
"running"
  The guest is fully launched or migrated in.
"send-update"
  The guest is currently being migrated out to another machine.
"receive-update"
  The guest is currently being migrated from another machine.
Since: 2.12
If: "defined(TARGET_I386)"
SevInfo (Object)
Information about Secure Encrypted Virtualization (SEV) support
Members:
"enabled: boolean"
  true if SEV is active
"api-major: int"
  SEV API major version
```

"api-minor: int"

reinjection backlog. Can be used if another mechanism to synchronize guest time is

Page 316/325

```
SEV API minor version
"build-id: int"
  SEV FW build id
"policy: int"
  SEV policy value
"state: SevState"
  SEV guest state
"handle: int"
  SEV firmware handle
Since: 2.12
If: "defined(TARGET_I386)"
query-sev (Command) Returns information about SEV
Returns: "SevInfo"
Since: 2.12
Example:
    -> { "execute": "query-sev" }
    <- { "return": { "enabled": true, "api-major": 0, "api-minor": 0,
               "build-id": 0, "policy": 0, "state": "running",
               "handle": 1 } }
If: "defined(TARGET_I386)"
SevLaunchMeasureInfo (Object)
SEV Guest Launch measurement information
Members:
"data: string"
  the measurement value encoded in base64
Since: 2.12
If: "defined(TARGET_I386)"
query-sev-launch-measure (Command) Query the SEV guest launch information.
Returns: The "SevLaunchMeasureInfo" for the guest
Since: 2.12
Example:
    -> { "execute": "query-sev-launch-measure" }
```

<- { "return": { "data": "4I8LXeNISPUDIXPJG5966/8%YZ" } }

```
If: "defined(TARGET I386)"
SevCapability (Object)
The struct describes capability for a Secure Encrypted Virtualization feature.
Members:
"pdh: string"
  Platform Diffie-Hellman key (base64 encoded)
"cert-chain: string"
  PDH certificate chain (base64 encoded)
"cbitpos: int"
  C-bit location in page table entry
"reduced-phys-bits: int"
  Number of physical Address bit reduction when SEV is enabled
Since: 2.12
If: "defined(TARGET_I386)"
query-sev-capabilities (Command) This command is used to get the SEV capabilities,
and is supported on AMD X86 platforms only.
Returns: SevCapability objects.
Since: 2.12
Example:
    -> { "execute": "query-sev-capabilities" }
     <- { "return": { "pdh": "8CCDD8DDD", "cert-chain": "888CCCDDDEE",
               "cbitpos": 47, "reduced-phys-bits": 5}}
If: "defined(TARGET_I386)"
dump-skeys (Command) Dump guest's storage keys
Arguments:
"filename: string"
  the path to the file to dump to
This command is only supported on s390 architecture.
Since: 2.5
Example:
    -> { "execute": "dump-skeys",
        "arguments": { "filename": "/tmp/skeys" } }
```

<- { "return": {} }

```
If: "defined(TARGET S390X)"
GICCapability (Object)
The struct describes capability for a specific GIC (Generic Interrupt Controller)
version. These bits are not only decided by QEMU/KVM software version, but also
decided by the hardware that the program is running upon.
Members:
"version: int"
  version of GIC to be described. Currently, only 2 and 3 are supported.
"emulated: boolean"
  whether current QEMU/hardware supports emulated GIC device in user space.
"kernel: boolean"
  whether current QEMU/hardware supports hardware accelerated GIC device in
  kernel.
Since: 2.6
If: "defined(TARGET_ARM)"
query-gic-capabilities (Command) This command is ARM-only. It will return a list
of GICCapability objects that describe its capability bits.
Returns: a list of GICCapability objects.
Since: 2.6
Example:
    -> { "execute": "query-gic-capabilities" }
     <- { "return": [{ "version": 2, "emulated": true, "kernel": false },
               { "version": 3, "emulated": false, "kernel": true } ] }
If: "defined(TARGET_ARM)"
AudiodevPerDirectionOptions (Object)
General audio backend options that are used for both playback and recording.
Members:
"mixing-engine: boolean" (optional)
  use QEMU's mixing engine to mix all streams inside QEMU and convert audio
  formats when not supported by the backend. When set to off, fixed-settings must
  be also off (default on, since 4.2)
"fixed-settings: boolean" (optional)
```

use fixed settings for host input/output. When off, frequency, channels and

```
format must not be specified (default true)
"frequency: int" (optional)
  frequency to use when using fixed settings (default 44100)
"channels: int" (optional)
  number of channels when using fixed settings (default 2)
"voices: int" (optional)
  number of voices to use (default 1)
"format: AudioFormat" (optional)
  sample format to use when using fixed settings (default s16)
"buffer-length: int" (optional)
  the buffer length in microseconds
Since: 4.0
AudiodevGenericOptions (Object)
Generic driver-specific options.
Members:
"in: AudiodevPerDirectionOptions" (optional)
  options of the capture stream
"out: AudiodevPerDirectionOptions" (optional)
  options of the playback stream
Since: 4.0
AudiodevAlsaPerDirectionOptions (Object)
Options of the ALSA backend that are used for both playback and recording.
Members:
"dev: string" (optional)
  the name of the ALSA device to use (default 'default')
"period-length: int" (optional)
  the period length in microseconds
"try-poll: boolean" (optional)
  attempt to use poll mode, falling back to non-polling access on failure
  (default true)
The members of "AudiodevPerDirectionOptions"
Since: 4.0
```

Options of the ALSA audio backend. Members: "in: AudiodevAlsaPerDirectionOptions" (optional) options of the capture stream "out: AudiodevAlsaPerDirectionOptions" (optional) options of the playback stream "threshold: int" (optional) set the threshold (in microseconds) when playback starts Since: 4.0 AudiodevCoreaudioPerDirectionOptions (Object) Options of the Core Audio backend that are used for both playback and recording. Members: "buffer-count: int" (optional) number of buffers The members of "AudiodevPerDirectionOptions" Since: 4.0 AudiodevCoreaudioOptions (Object) Options of the coreaudio audio backend. Members: "in: AudiodevCoreaudioPerDirectionOptions" (optional) options of the capture stream "out: AudiodevCoreaudioPerDirectionOptions" (optional) options of the playback stream Since: 4.0 AudiodevDsoundOptions (Object) Options of the DirectSound audio backend. Members: "in: AudiodevPerDirectionOptions" (optional) options of the capture stream "out: AudiodevPerDirectionOptions" (optional) options of the playback stream "latency: int" (optional)

add extra latency to playback in microseconds (default 10000)

Since: 4.0 AudiodevOssPerDirectionOptions (Object) Options of the OSS backend that are used for both playback and recording. Members: "dev: string" (optional) file name of the OSS device (default '/dev/dsp') "buffer-count: int" (optional) number of buffers "try-poll: boolean" (optional) attempt to use poll mode, falling back to non-polling access on failure (default true) The members of "AudiodevPerDirectionOptions" Since: 4.0 AudiodevOssOptions (Object) Options of the OSS audio backend. Members: "in: AudiodevOssPerDirectionOptions" (optional) options of the capture stream "out: AudiodevOssPerDirectionOptions" (optional) options of the playback stream "try-mmap: boolean" (optional) try using memory-mapped access, falling back to non-memory-mapped access on failure (default true) "exclusive: boolean" (optional) open device in exclusive mode (vmix won't work) (default false) "dsp-policy: int" (optional) set the timing policy of the device (between 0 and 10, where smaller number means smaller latency but higher CPU usage) or -1 to use fragment mode (option ignored on some platforms) (default 5) Since: 4.0 AudiodevPaPerDirectionOptions (Object) Options of the Pulseaudio backend that are used for both playback and recording.

Members:

Page 322/325

```
"name: string" (optional)
  name of the sink/source to use
"stream-name: string" (optional)
  name of the PulseAudio stream created by gemu. Can be used to identify the
  stream in PulseAudio when you create multiple PulseAudio devices or run
  multiple gemu instances (default: audiodev's id, since 4.2)
"latency: int" (optional)
  latency you want PulseAudio to achieve in microseconds (default 15000)
The members of "AudiodevPerDirectionOptions"
Since: 4.0
AudiodevPaOptions (Object)
Options of the PulseAudio audio backend.
Members:
"in: AudiodevPaPerDirectionOptions" (optional)
  options of the capture stream
"out: AudiodevPaPerDirectionOptions" (optional)
  options of the playback stream
"server: string" (optional)
  PulseAudio server address (default: let PulseAudio choose)
Since: 4.0
AudiodevWavOptions (Object)
Options of the wav audio backend.
Members:
"in: AudiodevPerDirectionOptions" (optional)
  options of the capture stream
"out: AudiodevPerDirectionOptions" (optional)
  options of the playback stream
"path: string" (optional)
  name of the way file to record (default 'qemu.way')
Since: 4.0
AudioFormat (Enum)
```

An enumeration of possible audio formats.

Values: Page 323/325

Audiodev (Object)

Options of an audio backend.

Members:

"id: string"

identifier of the backend

"driver: AudiodevDriver"

the backend driver to use

"timer-period: int" (optional)

timer period (in microseconds, 0: use lowest possible)

The members of "AudiodevGenericOptions" when "driver" is "none"

The members of "AudiodevAlsaOptions" when "driver" is "alsa"

The members of "AudiodevCoreaudioOptions" when "driver" is "coreaudio"

The members of "AudiodevDsoundOptions" when "driver" is "dsound"

The members of "AudiodevOssOptions" when "driver" is "oss"

The members of "AudiodevPaOptions" when "driver" is "pa"

The members of "AudiodevGenericOptions" when "driver" is "sdl"

The members of "AudiodevGenericOptions" when "driver" is "spice"

The members of "AudiodevWavOptions" when "driver" is "wav"
