Linux Ubuntu 22.4.5 Manual Pages on command 'runc-create.8'

$ man runc-create.8

runc-create (8"")   runc-create (8"")

NAME

    runc-create - create a container

SYNOPSIS

    runc create [option ...] container-id

DESCRIPTION

    The create command creates an instance of a container from a bundle. The bundle is

    a directory with a specification file named config.json, and a root filesystem.

OPTIONS

    --bundle|-b path : Path to the root of the bundle directory. Default is current

    directory.

    --console-socket path : Path to an AF_UNIX socket which will receive a file

    descriptor referencing the master end of the console's pseudoterminal. See

    docs/terminals

    ?https://github.com/opencontainers/runc/blob/master/docs/terminals.md?.

    --pid-file path : Specify the file to write the initial container process' PID to.

    --no-pivot : Do not use pivot root to jail process inside rootfs. This should not

    be used except in exceptional circumstances, and may be unsafe from the security

    standpoint.

    --no-new-keyring : Do not create a new session keyring for the container. This will

    cause the container to inherit the calling processes session key.

    --preserve-fds N : Pass N additional file descriptors to the container (stdio +

$LISTEN_FDS + N in total). Default is 0.
