Linux Ubuntu 22.4.5 Manual Pages on command 'runc-ps.8'

$ man runc-ps.8

runc-ps (8"")   runc-ps (8"")

NAME

    runc-ps - display the processes inside a container

SYNOPSIS

    runc ps [option ...] container-id [ps-option ...]

DESCRIPTION

    The command ps is a wrapper around the stock ps(1) utility, which filters its

    output to only contain processes belonging to a specified container-id. Therefore,

    the PIDs shown are the host PIDs.

    Any ps(1) options can be used, but some might break the filtering. In particular,

    if PID column is not available, an error is returned, and if there are columns with

    values containing spaces before the PID column, the result is undefined.

OPTIONS

    --format|-f table|json : Output format. Default is table. The json format shows a

    mere array of PIDs belonging to a container; if used, all ps options are gnored.

SEE ALSO

    runc-list(8), runc(8).
