$ man select-default-wordlist.8

SELECT-DEFAULT-WORDLIST(8)   SELECT-DEFAULT-WORDLIST(8)

NAME

    select-default-wordlist - select default wordlist

SYNOPSIS

    select-default-wordlist [options]

    Options (all long only options):

      --set-default='regexp' Try 'regexp' to get a single match and set

                   it as default. Fail otherwise.

      --show-choices   Show available choices to STDERR and exit.

      --debug   Enable debug mode

DESCRIPTION

    This program is responsible for selecting default wordlist.

    If --show-choices is used will just output a list of available choices to STDERR and exit.

    STDOUT cannot be used, this program loads debconf and debconf captures STDOUT.

    If --set-default is used, program will try to get a single regexp match from available

    choices, failing if not. Will try case dependent match first, then case independent.

If --set-default is not used this program will make debconf always ask the shared question about the default wordlist to be used in your system according to the installed ones.

In both cases, will do the appropriate settings if needed.

Calls internally update-default-wordlist.
