Rocky Enterprise Linux 9.2 Manual Pages on command 'setvtrgb.8'

$ man setvtrgb.8

SETVTRGB(8)   System Manager's Manual   SETVTRGB(8)

NAME

    setvtrgb - set the virtual terminal RGB colors

SYNOPSIS

    setvtrgb [options] vga|FILE|-

DESCRIPTION

    The setvtrgb command takes a single argument, either the string vga , or a path to a file

    containing the red, green, and blue colors to be used by the Linux virtual terminals.

    If you use the FILE parameter, FILE should be exactly 3 lines of 16 comma-separated deci?

    mal values for RED, GREEN, and BLUE.

    To seed a valid FILE :

        cat /sys/module/vt/parameters/default_{red,grn,blu} > FILE

    And then edit the values in FILE

OPTIONS

    -C, --console=DEV

        the console device to be used;

    -h, --help

        Prints usage message and exits.

    -V, --version

        Prints version number and exists.
