Rocky Enterprise Linux 9.2 Manual Pages on command 'xfs_mkfile.8'

$ man xfs_mkfile.8

xfs_mkfile(8)   System Manager's Manual   xfs_mkfile(8)

NAME

xfs_mkfile - create an XFS file

SYNOPSIS

xfs_mkfile [-v] [-n] [-p] size[k|b|m|g] filename ...

xfs_mkfile -V

DESCRIPTION

xfs_mkfile creates one or more files. The file is padded with zeroes by default. The de?

fault size is in bytes, but it can be flagged as kilobytes, blocks, megabytes, or giga?

bytes with the k, b, m, or g suffixes, respectively.

OPTIONS

-v   Verbose. Report the names and sizes of created files.

-n   No bytes. Create a holey file - that is, do not write out any data, just seek to
      end of file and write a block.

-p   Preallocate. The file is preallocated, then overwritten with zeroes, then trun?
      cated to the desired size.

-V   Prints the version number and exits.
