PowerShell Get-Help on command 'Get-NetIPHttpsState'

PS C:\Users\wahid> Get-Help Get-NetIPHttpsState

NAME

   Get-NetIPHttpsState

SYNOPSIS

   Gets the active IP-HTTPS state of a computer.

SYNTAX

   Get-NetIPHttpsState [-AsJob] [-CimSession <CimSession[]>] [-ThrottleLimit

   <Int32>] [<CommonParameters>]

DESCRIPTION

   The Get-NetIPHttpsState cmdlet gets the active IP-HTTPS state of a computer.

   If IP-HTTPS is not active, then this cmdlet does not return an object.

PARAMETERS

   -AsJob [<SwitchParameter>]

      Runs the cmdlet as a background job. Use this parameter to run commands

that take a long time to complete.

-CimSession <CimSession[]>

Runs the cmdlet in a remote session or on a remote computer. Enter a

computer name or a session object, such as the output of a New-CimSession

(https://go.microsoft.com/fwlink/p/?LinkId=227967) or

[Get-CimSession](https://go.microsoft.com/fwlink/p/?LinkId=227966)cmdlet.

The default is the current session on the local computer.

-ThrottleLimit <Int32>

Specifies the maximum number of concurrent operations that can be

established to run the cmdlet. If this parameter is omitted or a value of

`0` is entered, then Windows PowerShellr calculates an optimum throttle

limit for the cmdlet based on the number of CIM cmdlets that are running

on the computer. The throttle limit applies only to the current cmdlet,

not to the session or to the computer.

<CommonParameters>

This cmdlet supports the common parameters: Verbose, Debug,

ErrorAction, ErrorVariable, WarningAction, WarningVariable,

OutBuffer, PipelineVariable, and OutVariable. For more information, see

about_CommonParameters (https:/go.microsoft.com/fwlink/?LinkID=113216).

----------- Example 1: Get the active IP-HTTPS state -----------

PS C:\>Get-NetIPHttpsState

This command gets the active IP-HTTPS state of the computer.
