PowerShell Get-Help on command 'Get-NetTeredoState'

PS C:\Users\wahid> Get-Help Get-NetTeredoState

NAME

Get-NetTeredoState

SYNOPSIS

Retrieves the active Teredo state of the local computer.

SYNTAX

```
Get-NetTeredoState [-AsJob] [-CimSession <CimSession[]>] [-ThrottleLimit  
<Int32>] [<CommonParameters>]
```

DESCRIPTION

The Get-NetTeredoState cmdlet retrieves the active Teredo state of the local computer.

If Teredo is not active, then this cmdlet does not return an object.

PARAMETERS

-AsJob [<SwitchParameter>]

Runs the cmdlet as a background job. Use this parameter to run commands that take a long time to complete.

-CimSession <CimSession[]>

Runs the cmdlet in a remote session or on a remote computer. Enter a computer name or a session object, such as the output of a New-CimSession (<https://go.microsoft.com/fwlink/?LinkId=227967>) or [Get-CimSession] (<https://go.microsoft.com/fwlink/?LinkId=227966>) cmdlet.

The default is the current session on the local computer.

-ThrottleLimit <Int32>

Specifies the maximum number of concurrent operations that can be established to run the cmdlet. If this parameter is omitted or a value of `0` is entered, then Windows PowerShell calculates an optimum throttle limit for the cmdlet based on the number of CIM cmdlets that are running on the computer. The throttle limit applies only to the current cmdlet, not to the session or to the computer.

<CommonParameters>

This cmdlet supports the common parameters: Verbose, Debug, ErrorAction, ErrorVariable, WarningAction, WarningVariable, OutBuffer, PipelineVariable, and OutVariable. For more information, see about_CommonParameters (<https://go.microsoft.com/fwlink/?LinkID=113216>).

----- Example 1: Get the active Teredo state -----

```
PS C:\>Get-NetTeredoState
```

This command retrieves the active Teredo state of the local computer.
