Red Hat Enterprise Linux Release 9.2 Manual Pages on 'cockpit-bridge.1' command

\$ man cockpit-bridge.1

COCKPIT-BRIDGE(1) cockpit-bridge COCKPIT-BRIDGE(1)

NAME

cockpit-bridge - Cockpit Host Bridge

SYNOPSIS

cockpit-bridge [--help] [--packages]

DESCRIPTION

The cockpit-bridge program is used by Cockpit to relay messages and commands from the Web front end to the server. Among other things it relays Dbus, and spawns processes on behalf of the Web user interface.

This program is not routinely run by users or administrators. It is in the \$PATH so that Cockpit can find it when connecting between hosts.

However there are some diagnostics available when running from the command line.

OPTIONS

--help

Show help options.

--interact=boundary

Interact with the raw cockpit1 protocol. Useful for debugging and testing. Specify a boundary which should be on an empty line between messages.

--packages

List all available Cockpit packages and exit. Note this includes packages available to the user running this command.

BUGS

Please send bug reports to either the distribution bug tracker or the upstream bug tracker[1].

AUTHOR

Cockpit has been written by many contributors[2].
