$ man dnf-repomanage.8

DNF-REPOMANAGE(8)   dnf-plugins-core   DNF-REPOMANAGE(8)

NAME

    dnf-repomanage - DNF repomanage Plugin

    Manage a repository or a simple directory of rpm packages.

SYNOPSIS

    dnf repomanage [<optional-options>] [<options>] <path>

DESCRIPTION

    repomanage prints newest or older packages in a repository specified by

    <path> for easy piping to xargs or similar programs. In case <path>

    doesn't contain a valid repodata, it is searched for rpm packages which

    are then used instead. If the repodata are present, repomanage uses

    them as the source of truth, it doesn't verify that they match the

    present rpm packages. In fact, repomanage can run with just the repo?

    data, no rpm packages are needed.

    In order to work correctly with modular packages, <path> has to contain

    repodata with modular metadata. If modular content is present, repoman?

    age prints packages from newest or older stream versions in addition to

    newest or older non-modular packages.

  Options

    All general DNF options are accepted, see Options in dnf(8) for de?

    tails.

    The following options set what packages are displayed. These options

    are mutually exclusive, i.e. only one can be specified. If no option is

specified, the newest packages are shown.

--old Show older packages (for a package or a stream show all versions

except the newest one).

--oldonly

Show older packages (same as --old, but exclude the newest pack?

ages even when it's included in the older stream versions).

--new Show newest packages.

The following options control how packages are displayed in the output:

-s, --space

Print resulting set separated by space instead of newline.

-k <keep-number>, --keep <keep-number>

Limit the resulting set to newest <keep-number> packages.

EXAMPLES

Display newest packages in current repository (directory):

dnf repomanage --new .

Display 2 newest versions of each package in "home" directory:

dnf repomanage --new --keep 2 ~/

Display oldest packages separated by space in current repository (di?

rectory):

dnf repomanage --old --space .
