DESCRIPTION

The ffs() function returns the position of the first (least significant) bit set in the word i. The least significant bit is position 1 and the most significant position is, for example, 32 or 64. The functions ffsll() and ffsi() do the same but take arguments of possibly different size.

RETURN VALUE

These functions return the position of the first bit set, or 0 if no bits are set in i.

ATTRIBUTES

For an explanation of the terms used in this section, see attributes(7).

CONFORMING TO

ffs(): POSIX.1-2001, POSIX.1-2008, 4.3BSD.
The ffsi() and ffsll() functions are glibc extensions.

NOTES

BSD systems have a prototype in <string.h>.
