## **Red Hat Enterprise Linux Release 9.2 Manual Pages on 'ippfind.1' command**

**\$ man ippfind.1**

ippfind(1) Apple Inc. ippfind(1)

### NAME

ippfind - find internet printing protocol printers

### SYNOPSIS

ippfind [ options ] regtype[,subtype][.domain.] ... [ expression

... ]

ippfind [ options ] name[.regtype[.domain.]] ... [ expression

... ]

ippfind --help

ippfind --version

### DESCRIPTION

ippfind finds services registered with a DNS server or available through local devices. Its primary purpose is to find IPP printers and show their URIs, show their current status, or run commands.

### REGISTRATION TYPES

ippfind supports the following registration types:

\_http.\_tcp

HyperText Transport Protocol (HTTP, RFC 2616)

\_https.\_tcp

Secure HyperText Transport Protocol (HTTPS, RFC 2818)

\_ipp.\_tcp

Internet Printing Protocol (IPP, RFC 2911)

\_ipps.\_tcp

## Secure Internet Printing Protocol (IPPS, draft)

\_printer.\_tcp

Line Printer Daemon (LPD, RFC 1179)

### EXPRESSIONS

ippfind supports expressions much like the find(1) utility. However, unlike find(1), ippfind uses POSIX regular expressions instead of shell filename matching patterns. If --exec, -l, --ls, -p, --print, --print-name, -q, --quiet, -s, or -x is not specified, ippfind adds --print to print the service URI of anything it finds. The following expressions are supported:

-d regex

--domain regex

True if the domain matches the given regular expression.

--false

Always false.

-h regex

--host regex

True if the hostname matches the given regular expression.

-l

--ls Lists attributes returned by Get-Printer-Attributes for IPP print?

ers and traditional find "-ls" output for HTTP URLs. The result

is true if the URI is accessible, false otherwise.

--local

True if the service is local to this computer.

-N name

--literal-name name

True if the service instance name matches the given name.

-n regex

--name regex

True if the service instance name matches the given regular expression.

--path regex

True if the URI resource path matches the given regular expression.

sion.

-P number[-number]

--port number[-number]

True if the port matches the given number or range.

-p

--print

Prints the URI if the result of previous expressions is true. The result is always true.

-q

--quiet

Quiet mode - just returns the exit codes below.

-r

--remote

True if the service is not local to this computer.

-s

--print-name

Prints the service instance name if the result of previous expressions is true. The result is always true.

--true

Always true.

-t key

--txt key

True if the TXT record contains the named key.

--txt-key regex

True if the TXT record contains the named key and matches the given regular expression.

-u regex

--uri regex

True if the URI matches the given regular expression.

-x utility [ argument ... ] ;

--exec utility [ argument ... ] ;

Executes the specified program if the current result is true.

"{foo}" arguments are replaced with the corresponding value - see

## SUBSTITUTIONS below.

Expressions may also contain modifiers:

( expression )

Group the result of expressions.

! expression

--not expression

Unary NOT of the expression.

expression expression

expression --and expression

Logical AND of expressions.

expression --or expression

Logical OR of expressions.

## SUBSTITUTIONS

The substitutions for "{foo}" in -e and --exec are:

{service\_domain}

Domain name, e.g., "example.com.", "local.", etc.

{service\_hostname}

Fully-qualified domain name, e.g., "printer.example.com.",  
"printer.local.", etc.

{service\_name}

Service instance name, e.g., "My Fine Printer".

{service\_port}

Port number for server, typically 631 for IPP and 80 for HTTP.

{service\_rectype}

DNS-SD registration type, e.g., "\_ipp.\_tcp", "\_http.\_tcp", etc.

{service\_scheme}

URI scheme for DNS-SD registration type, e.g., "ipp", "http", etc.

{}

{service\_uri}

URI for service, e.g., "ipp://printer.local./ipp/print",  
"http://printer.local./", etc.

{txt\_key}

Value of TXT record key (lowercase).

## **OPTIONS**

ippfind supports the following options:

**--help**

Show program help.

**--version**

Show program version.

**-4** Use IPv4 when listing.

**-6** Use IPv6 when listing.

**-T** seconds

Specify find timeout in seconds. If 1 or less, ippfind stops as soon as it thinks it has found everything. The default timeout is 1 second.

**-V** version

Specifies the IPP version when listing. Supported values are "1.1", "2.0", "2.1", and "2.2".

## **EXIT STATUS**

ippfind returns 0 if the result for all processed expressions is true, 1 if the result of any processed expression is false, 2 if browsing or any query or resolution failed, 3 if an undefined option or invalid expression was specified, and 4 if it ran out of memory.

## **ENVIRONMENT**

When executing a program, ippfind sets the following environment variables for the matching service registration:

**IPPFIND\_SERVICE\_DOMAIN**

Domain name, e.g., "example.com.", "local.", etc.

**IPPFIND\_SERVICE\_HOSTNAME**

Fully-qualified domain name, e.g., "printer.example.com.", "printer.local.", etc.

**IPPFIND\_SERVICE\_NAME**

Service instance name, e.g., "My Fine Printer".

**IPPFIND\_SERVICE\_PORT**

Port number for server, typically 631 for IPP and 80 for HTTP.

**IPPFIND\_SERVICE\_REGTYPE**

DNS-SD registration type, e.g., "\_ipp.\_tcp", "\_http.\_tcp", etc.

#### IPPFIND\_SERVICE\_SCHEME

URI scheme for DNS-SD registration type, e.g., "ipp", "http", etc.

#### IPPFIND\_SERVICE\_URI

URI for service, e.g., "ipp://printer.local./ipp/print",

"http://printer.local./", etc.

#### IPPFIND\_TXT\_KEY

Values of TXT record KEY (uppercase).

### EXAMPLES

To show the status of all registered IPP printers on your network, run:

```
ippfnd --ls
```

Similarly, to send a PostScript test page to every PostScript printer,

run:

```
ippfnd --txt-pdl application/postscript --exec ipptool  
-f onepage-letter.ps '{}' print-job.test \;
```
