Red Hat Enterprise Linux Release 9.2 Manual Pages on 'jose-alg.1' command

$ man jose-alg.1

JOSE-ALG(1)   JOSE-ALG(1)

NAME

    jose-alg - Lists all supported algorithms

SYNOPSIS

    jose alg [-k KIND]

OVERVIEW

    The jose alg command lists the algorithms supported by all jose

    commands.

    Since jose supports different kinds of algorithms (encryption, signing,

    hashing, etc.), you can limit the kinds of algorithms you would like to

    see using the -k option (which can be specified multiple times). For a

    list of the different kinds of algorithms, use the -k ? option. If the

    -k option is not used, all algorithms, regardless of their kind, will

    be listed.

OPTIONS

    ?   -k KIND, --kind=KIND : Restrict algorithm list to a certain kind

    ?   -k ?, --kind=? : List valid algorithm kinds

EXAMPLES

    List all encryption algorithms:

        $ jose alg -k encr

        A128CBC-HS256

        A128GCM

        A192CBC-HS384

A192GCM

A256CBC-HS512

A256GCM
