## ***Red Hat Enterprise Linux Release 9.2 Manual Pages on 'libcbor.1' command***

***\$ man libcbor.1***

LIBCBOR(1) libcbor LIBCBOR(1)

### NAME

libcbor - libcbor Documentation

Documentation for version 0.7.0, updated on Aug 09, 2021.

### OVERVIEW

libcbor is a C library for parsing and generating CBOR, the general-purpose schema-less binary data format.

#### Main features

- ? Complete RFC conformance [1]
- ? Robust C99 implementation
- ? Layered architecture offers both control and convenience
- ? Flexible memory management
- ? No shared global state - threading friendly [2]
- ? Proper handling of UTF-8
- ? Full support for streams & incremental processing
- ? Extensive documentation and test suite
- ? No runtime dependencies, small footprint

[1] See rfc\_conformance

[2] With the exception of custom memory allocators (see api/item\_reference\_counting)

### CONTENTS

#### Getting started

Pre-built Linux packages are distributed from the libcbor website.

Building using make

CMake will generate a Makefile and other configuration files for the build. As a rule of thumb, you should configure the build out of side of the source tree in order to keep different configurations isolated. If you are unsure where to execute the build, just use a temporary directory:

```
cd $(mktemp -d /tmp/cbor_build.XXXX)
```

Now, assuming you are in the directory where you want to build, execute the following to configure the build and run make

```
cmake -DCMAKE_BUILD_TYPE=Release path_to_libcbor_dir
make cbor cbor_shared
```

Both the shared (libcbor.so) and the static (libcbor.a) libraries should now be in the src subdirectory.

In order to install the libcbor headers and libraries, the usual `make install`

is what you're looking for. Root permissions are required on most systems when using the default installation prefix.

Portability

libcbor is highly portable and works on both little- and big-endian systems regardless of the operating system. After building on an exotic platform, you might wish to verify the result by running the test suite. If you encounter any problems, please report them to the issue tracker.

libcbor is known to successfully work on ARM Android devices. Cross-compilation is possible with `arm-linux-gnueabi-gcc`.

Linking with libcbor

If you include and linker paths include the directories to which libcbor has been installed, compiling programs that uses libcbor requires no extra considerations.

You can verify that everything has been set up properly by creating a file with the following contents

```
#include <cbor.h>
#include <stdio.h>
```

```
int main(int argc, char * argv[])
{
    printf("Hello from libcbor %s\n", CBOR_VERSION);
}
```

and compiling it

```
cc hello_cbor.c -lcbor -o hello_cbor
```

libcbor also comes with pkg-config support. If you install libcbor with a custom prefix, you can use pkg-config to resolve the headers and objects:

```
cc $(pkg-config --cflags libcbor) hello_cbor.c $(pkg-config --libs libcbor) -o hello_cbor
```

A note on linkage

libcbor is primarily intended to be linked statically. The shared library versioning scheme generally follows SemVer, but is irregular for the 0.X.Y development branch for historical reasons. The following version identifiers are used as a part of the SONAME (Linux) or the dylib "Compatibility version" (OS X):

0.Y for the 0.Y.Z branch. Patches are backwards compatible, minor releases are generally not and require re-compilation of any dependent code.

X for the X.Y.Z stable versions starting 1.X.Y. All minor releases of the major version are backwards compatible.

WARNING:

Please note that releases up to and including v0.6.0 may export misleading .so/.dylib version number.

MinGW build instructions

Prerequisites:

• MinGW

• CMake GUI

First of all, create a folder that will be used for the output. For this demonstration, we will use cbor\_out. Start CMake and select the source path and the destination folder. [image]

Then hit the 'Configure' button. You will be prompted to select the build system: [image]

Choose MinGW and confirm.

#### NOTE:

If you select Visual Studio at this point, a MSVC project will be generated for you. This is useful if you just want to browse through the source code.

You can then adjust the build options. The defaults will work just fine. Hit 'Generate' when you are done. [image]

You can then adjust the build options. The defaults will work just fine. Hit 'Generate' when you are done.

Open the shell, navigate to the output directory, and run `mingw32-make cbor cbor_shared`. [image]

`libcbor` will be built and your `.dll` should be ready at this point [image]

Feel free to also try building and running some of the examples, e.g. `mingw32-make sort` [image]

#### Troubleshooting

`cbor.h` not found: The headers directory is probably not in your include path. First, verify the installation location by checking the installation log. If you used `make`, it will look something like

```
...
-- Installing: /usr/local/include/cbor
-- Installing: /usr/local/include/cbor/callbacks.h
-- Installing: /usr/local/include/cbor/encoding.h
...
```

Make sure that `CMAKE_INSTALL_PREFIX` (if you provided it) was correct.

Including the path during compilation should suffice, e.g.:

```
cc -I/usr/local/include hello_cbor.c -lcbor -o hello_cbor
```

cannot find `-lcbor` during linking: Most likely the same problem as before. Include the installation directory in the linker shared path using

`-R`, e.g.:

```
cc -Wl,-rpath,/usr/local/lib -lcbor -o hello_cbor
```

shared library missing during execution: Verify the linkage using `ldd`, `otool`, or similar and adjust the compilation directives accordingly:

? ldd hello\_cbor

linux-vdso.so.1 => (0x00007ffe85585000)

libcbor.so => /usr/local/lib/libcbor.so (0x00007f9af69da000)

libc.so.6 => /lib/x86\_64-linux-gnu/libc.so.6 (0x00007f9af65eb000)

/lib64/ld-linux-x86-64.so.2 (0x00007f9af6be9000)

compilation failed: If your compiler supports C99 yet the compilation has failed, please report the issue to the issue tracker.

Usage & preliminaries

Version information

libcbor exports its version using three self-explanatory macros:

? CBOR\_MAJOR\_VERSION

? CBOR\_MINOR\_VERSION

? CBOR\_PATCH\_VERSION

The CBOR\_VERSION is a string concatenating these three identifiers into one (e.g. 0.2.0).

In order to simplify version comparisons, the version is also exported as

```
#define CBOR_HEX_VERSION ((CBOR_MAJOR_VERSION << 16) | (CBOR_MINOR_VERSION << 8) |
```

```
CBOR_PATCH_VERSION)
```

Since macros are difficult to work with through FFIs, the same information is also available through three uint8\_t constants, namely

? cbor\_major\_version

? cbor\_minor\_version

? cbor\_patch\_version

Headers to include

The cbor.h header includes all the symbols. If, for any reason, you don't want to include all the exported symbols, feel free to use just some of the cbor/\*.h headers:

? cbor/arrays.h - api/type\_4

? cbor/bytestrings.h - api/type\_2

? cbor/callbacks.h - Callbacks used for streaming/decoding

? cbor/common.h - Common utilities - always transitively included

? cbor/data.h - Data types definitions - always transitively in?

cluded

? cbor/encoding.h - Streaming encoders for streaming/encoding

? cbor/floats\_ctrls.h - api/type\_7

? cbor/ints.h - api/type\_0\_1

? cbor/maps.h - api/type\_5

? cbor/serialization.h - High level serialization such as cbor\_ser?

alize()

? cbor/streaming.h - Home of cbor\_stream\_decode()

? cbor/strings.h - api/type\_3

? cbor/tags.h - api/type\_6

## Using libcbor

If you want to get more familiar with CBOR, we recommend the [cbor.io](http://cbor.io) website. Once you get the grasp of what is it CBOR does, the examples (located in the examples directory) should give you a good feel of the API. The API documentation should then provide with all the information you may need.

## Creating and serializing items

```
#include "cbor.h"

#include <stdio.h>

int main(int argc, char * argv[])
{
    /* Preallocate the map structure */
    cbor_item_t * root = cbor_new_definite_map(2);

    /* Add the content */
    cbor_map_add(root, (struct cbor_pair) {
        .key = cbor_move(cbor_build_string("Is CBOR awesome?")),
        .value = cbor_move(cbor_build_bool(true))
    });

    cbor_map_add(root, (struct cbor_pair) {
        .key = cbor_move(cbor_build_uint8(42)),
        .value = cbor_move(cbor_build_string("Is the answer"))
    });

    /* Output: `length` bytes of data in the `buffer` */
```

```

unsigned char * buffer;

size_t buffer_size, length = cbor_serialize_alloc(root, &buffer, &buffer_size);

fwrite(buffer, 1, length, stdout);

free(buffer);

fflush(stdout);

cbor_decref(&root);

}

```

#### Reading serialized data

```

#include "cbor.h"

#include <stdio.h>

/*
 * Reads data from a file. Example usage:
 * $ ./examples/readfile examples/data/nested_array.cbor
 */

int main(int argc, char * argv[])
{
    FILE * f = fopen(argv[1], "rb");

    fseek(f, 0, SEEK_END);

    size_t length = (size_t)ftell(f);

    fseek(f, 0, SEEK_SET);

    unsigned char * buffer = malloc(length);

    fread(buffer, length, 1, f);

    /* Assuming `buffer` contains `info.st_size` bytes of input data */

    struct cbor_load_result result;

    cbor_item_t * item = cbor_load(buffer, length, &result);

    /* Pretty-print the result */

    cbor_describe(item, stdout);

    fflush(stdout);

    /* Deallocate the result */

    cbor_decref(&item);

    fclose(f);

}

```

```

#include "cbor.h"
#include <stdio.h>
#include <string.h>
/*
 * Illustrates how one might skim through a map (which is assumed to have
 * string keys and values only), looking for the value of a specific key
 *
 * Use the examples/data/map.cbor input to test this.
 */
const char * key = "a secret key";
bool key_found = false;
void find_string(void * _ctx, cbor_data buffer, size_t len)
{
    if (key_found) {
        printf("Found the value: %*s\n", (int) len, buffer);
        key_found = false;
    } else if (len == strlen(key)) {
        key_found = (memcmp(key, buffer, len) == 0);
    }
}
int main(int argc, char * argv[])
{
    FILE * f = fopen(argv[1], "rb");
    fseek(f, 0, SEEK_END);
    size_t length = (size_t)ftell(f);
    fseek(f, 0, SEEK_SET);
    unsigned char * buffer = malloc(length);
    fread(buffer, length, 1, f);
    struct cbor_callbacks callbacks = cbor_empty_callbacks;
    struct cbor_decoder_result decode_result;
    size_t bytes_read = 0;
    callbacks.string = find_string;
    while (bytes_read < length) {

```

```

    decode_result = cbor_stream_decode(buffer + bytes_read,
                                      length - bytes_read,
                                      &callbacks, NULL);

    bytes_read += decode_result.read;
}

fclose(f);
}

```

## API

The data API is centered around `cbor_item_t`, a generic handle for any CBOR item. There are functions to

- ? create items,
- ? set items' data,
- ? parse serialized data into items,
- ? manage, move, and links item together.

The single most important thing to keep in mind is: `cbor_item_t` is an opaque type and should only be manipulated using the appropriate functions! Think of it as an object.

The `libcbor` API closely follows the semantics outlined by CBOR standard. This part of the documentation provides a short overview of the CBOR constructs, as well as a general introduction to the `libcbor` API. Remaining reference can be found in the following files structured by data types.

The API is designed to allow both very tight control & flexibility and general convenience with sane defaults. [1] For example, client with very specific requirements (constrained environment, custom application protocol built on top of CBOR, etc.) may choose to take full control (and responsibility) of memory and data structures management by interacting directly with the decoder. Other clients might want to take control of specific aspects (streamed collections, hash maps storage), but leave other responsibilities to `libcbor`. More general clients might prefer to be abstracted away from all aforementioned details and only be presented complete data structures.

`libcbor` provides

- ? stateless encoders and decoders
- ? encoding and decoding drivers, routines that coordinate encoding and decoding of complex structures
- ? data structures to represent and transform CBOR structures
- ? routines for building and manipulating these structures
- ? utilities for inspection and debugging

## Types of items

Every `cbor_item_t` has a `cbor_type` associated with it - these constants correspond to the types specified by the CBOR standard:

enum `cbor_type`

Specifies the Major type of `cbor_item_t`.

Values:

enumerator `CBOR_TYPE_UINT`

0 - positive integers

enumerator `CBOR_TYPE_NEGINT`

1 - negative integers

enumerator `CBOR_TYPE_BYTESTRING`

2 - byte strings

enumerator `CBOR_TYPE_STRING`

3 - strings

enumerator `CBOR_TYPE_ARRAY`

4 - arrays

enumerator `CBOR_TYPE_MAP`

5 - maps

enumerator `CBOR_TYPE_TAG`

6 - tags

enumerator `CBOR_TYPE_FLOAT_CTRL`

7 - decimals and special values (true, false, nil, ...)

To find out the type of an item, one can use

```
cbor_type cbor_typeof(const cbor_item_t *item)
```

Get the type of the item.

Return The type

Parameters

? item[borrow]:

Please note the distinction between functions like `cbor_isa_uint()` and `cbor_is_int()`. The following functions work solely with the major type value.

#### Binary queries

Alternatively, there are functions to query each particular type.

#### WARNING:

Passing an invalid `cbor_item_t` reference to any of these functions results in undefined behavior.

`bool cbor_isa_uint(const cbor_item_t *item)`

Does the item have the appropriate major type?

Return Is the item an `CBOR_TYPE_UINT`?

Parameters

? item[borrow]: the item

`bool cbor_isa_negint(const cbor_item_t *item)`

Does the item have the appropriate major type?

Return Is the item a `CBOR_TYPE_NEGINT`?

Parameters

? item[borrow]: the item

`bool cbor_isa_bytestring(const cbor_item_t *item)`

Does the item have the appropriate major type?

Return Is the item a `CBOR_TYPE_BYTESTRING`?

Parameters

? item[borrow]: the item

`bool cbor_isa_string(const cbor_item_t *item)`

Does the item have the appropriate major type?

Return Is the item a `CBOR_TYPE_STRING`?

Parameters

? item[borrow]: the item

`bool cbor_isa_array(const cbor_item_t *item)`

Does the item have the appropriate major type?

Return Is the item an `CBOR_TYPE_ARRAY`?

Parameters

? item[borrow]: the item

bool cbor\_isa\_map(const cbor\_item\_t \*item)

Does the item have the appropriate major type?

Return Is the item a CBOR\_TYPE\_MAP?

Parameters

? item[borrow]: the item

bool cbor\_isa\_tag(const cbor\_item\_t \*item)

Does the item have the appropriate major type?

Return Is the item a CBOR\_TYPE\_TAG?

Parameters

? item[borrow]: the item

bool cbor\_isa\_float\_ctrl(const cbor\_item\_t \*item)

Does the item have the appropriate major type?

Return Is the item a CBOR\_TYPE\_FLOAT\_CTRL?

Parameters

? item[borrow]: the item

## Logical queries

These functions provide information about the item type from a more high-level perspective

bool cbor\_is\_int(const cbor\_item\_t \*item)

Is the item an integer, either positive or negative?

Return Is the item an integer, either positive or negative?

Parameters

? item[borrow]: the item

bool cbor\_is\_float(const cbor\_item\_t \*item)

Is the item an a floating point number?

Return Is the item a floating point number?

Parameters

? item[borrow]: the item

bool cbor\_is\_bool(const cbor\_item\_t \*item)

Is the item an a boolean?

Return Is the item a boolean?

Parameters

? item[borrow]: the item

bool cbor\_is\_null(const cbor\_item\_t \*item)

Does this item represent null

WARNING:

This is in no way related to the value of the pointer. Pass?

ing a

null pointer will most likely result in a crash.

.INDENT 7.0

Return Is the item (CBOR logical) null?

Parameters

? item[borrow]: the item

bool cbor\_is\_undef(const cbor\_item\_t \*item)

Does this item represent undefined

WARNING:

Care must be taken to distinguish nulls and undefined values

in

C.

.INDENT 7.0

Return Is the item (CBOR logical) undefined?

Parameters

? item[borrow]: the item

Memory management and reference counting

Due to the nature of its domain, libcbor will need to work with heap memory. The stateless decoder and encoder don't allocate any memory.

If you have specific requirements, you should consider rolling your own driver for the stateless API.

Using custom allocator

libcbor gives you with the ability to provide your own implementations of malloc, realloc, and free. This can be useful if you are using a custom allocator throughout your application, or if you want to implement custom policies (e.g. tighter restrictions on the amount of allocated memory).

In order to use this feature, libcbor has to be compiled with the ap?

appropriate flags. You can verify the configuration using the `CBOR_CUS?`

`TOM_ALLOC` macro. A simple usage might be as follows:

```
#if CBOR_CUSTOM_ALLOC
    cbor_set_allocs(malloc, realloc, free);
#else
    #error "libcbor built with support for custom allocation is required"
#endif
```

```
void cbor_set_allocs(_cbor_malloc_t custom_malloc, _cbor_realloc_t cus?
tom_realloc, _cbor_free_t custom_free)
```

Sets the memory management routines to use.

Only available when `CBOR_CUSTOM_ALLOC` is truthy

WARNING:

This function modifies the global state and should therefore be used accordingly. Changing the memory handlers while allocated items exist will result in a free/malloc mismatch. This function is not thread safe with respect to both itself and all the other libcbor functions that work with the heap. .. note:: realloc implementation must correctly support NULL reallocation (see e.g. <http://en.cppreference.com/w/c/memory/realloc>)

Parameters

? `custom_malloc`: malloc implementation

? `custom_realloc`: realloc implementation

? `custom_free`: free implementation

Reference counting

As CBOR items may require complex cleanups at the end of their life time, there is a reference counting mechanism in place. This also enables very simple GC when integrating libcbor into managed environment.

Every item starts its life (by either explicit creation, or as a result of parsing) with reference count set to 1. When the refcount reaches zero, it will be destroyed.

Items containing nested items will be destroyed recursively - refcount of every nested item will be decreased by one.

The destruction is synchronous and renders any pointers to items with refcount zero invalid immediately after calling the `cbor_decref()`.

```
cbor_item_t *cbor_incref(cbor_item_t *item)
```

Increases the reference count by one.

No dependent items are affected.

Return the input reference

Parameters

? item[incref]: item the item

```
void cbor_decref(cbor_item_t **item)
```

Decreases the reference count by one, deallocating the item if needed.

In case the item is deallocated, the reference count of any dependent items is adjusted accordingly in a recursive manner.

Parameters

? item[take]: the item. Set to NULL if deallocated

```
void cbor_intermediate_decref(cbor_item_t *item)
```

Decreases the reference count by one, deallocating the item if needed.

Convenience wrapper for `cbor_decref` when its set-to-null behavior is not needed

Parameters

? item[take]: the item

```
size_t cbor_refcount(const cbor_item_t *item)
```

Get the reference count.

WARNING:

This does not account for transitive references.

Return the reference count

Parameters

? item[borrow]: the item

```
cbor_item_t *cbor_move(cbor_item_t *item)
```

Provides CPP-like move construct.

Decreases the reference count by one, but does not deallocate the item even if its refcount reaches zero. This is useful for

enumerator CBOR\_ERR\_NONE

enumerator CBOR\_ERR\_NOTENOUGHDATA

enumerator CBOR\_ERR\_NODATA

enumerator CBOR\_ERR\_MALFORMATED

enumerator CBOR\_ERR\_MEMERROR

Memory error - item allocation failed.

Is it too big for your allocator?

enumerator CBOR\_ERR\_SYNTAXERROR

Stack parsing algorithm failed.

struct cbor\_load\_result

High-level decoding result.

Public Members

struct cbor\_error error

Error indicator.

size\_t read

Number of bytes read.

struct cbor\_error

High-level decoding error.

Public Members

size\_t position

Aproximate position.

cbor\_error\_code code

Description.

## Encoding

The easiest way to encode data items is using the `cbor_serialize()` or `cbor_serialize_alloc()` functions:

```
size_t cbor_serialize(const cbor_item_t *item, cbor_mutable_data buf?  
fer, size_t buffer_size)
```

Serialize the given item.

Return Length of the result. 0 on failure.

Parameters

? item[borrow]: A data item

? buffer: Buffer to serialize to

? `buffer_size`: Size of the buffer

```
size_t cbor_serialize_alloc(const cbor_item_t *item, cbor_mutable_data
*buffer, size_t *buffer_size)
```

Serialize the given item, allocating buffers as needed.

WARNING:

It is your responsibility to free the buffer using an appropriate free implementation.

Return Length of the result. 0 on failure, in which case `buffer` is NULL.

Parameters

? `item[borrow]`: A data item

? `buffer[out]`: Buffer containing the result

? `buffer_size[out]`: Size of the buffer

#### Type-specific serializers

In case you know the type of the item you want to serialize beforehand, you can use one of the type-specific serializers.

NOTE:

Unless compiled in debug mode, these do not verify the type. Passing an incorrect item will result in an undefined behavior.

```
size_t cbor_serialize_uint(const cbor_item_t *item, cbor_mutable_data
buffer, size_t buffer_size)
```

Serialize an uint.

Return Length of the result. 0 on failure.

Parameters

? `item[borrow]`: A uint

? `buffer`: Buffer to serialize to

? `buffer_size`: Size of the buffer

```
size_t cbor_serialize_negint(const cbor_item_t *item, cbor_mutable_data
buffer, size_t buffer_size)
```

Serialize a negint.

Return Length of the result. 0 on failure.

Parameters

? `item[borrow]`: A negint

? buffer: Buffer to serialize to

? buffer\_size: Size of the buffer

size\_t cbor\_serialize\_bytestring(const cbor\_item\_t \*item, cbor\_mutable\_data buffer, size\_t buffer\_size)

Serialize a bytestring.

Return Length of the result. 0 on failure.

Parameters

? item[borrow]: A bytestring

? buffer: Buffer to serialize to

? buffer\_size: Size of the buffer

size\_t cbor\_serialize\_string(const cbor\_item\_t \*item, cbor\_mutable\_data buffer, size\_t buffer\_size)

Serialize a string.

Return Length of the result. 0 on failure.

Parameters

? item[borrow]: A string

? buffer: Buffer to serialize to

? buffer\_size: Size of the buffer

size\_t cbor\_serialize\_array(const cbor\_item\_t \*item, cbor\_mutable\_data buffer, size\_t buffer\_size)

Serialize an array.

Return Length of the result. 0 on failure.

Parameters

? item[borrow]: An array

? buffer: Buffer to serialize to

? buffer\_size: Size of the buffer

size\_t cbor\_serialize\_map(const cbor\_item\_t \*item, cbor\_mutable\_data buffer, size\_t buffer\_size)

Serialize a map.

Return Length of the result. 0 on failure.

Parameters

? item[borrow]: A map

? buffer: Buffer to serialize to

? buffer\_size: Size of the buffer

size\_t cbor\_serialize\_tag(const cbor\_item\_t \*item, cbor\_mutable\_data  
buffer, size\_t buffer\_size)

Serialize a tag.

Return Length of the result. 0 on failure.

Parameters

? item[borrow]: A tag

? buffer: Buffer to serialize to

? buffer\_size: Size of the buffer

size\_t cbor\_serialize\_float\_ctrl(const cbor\_item\_t \*item, cbor\_mutable\_data  
buffer, size\_t buffer\_size)

Serialize a.

Return Length of the result. 0 on failure.

Parameters

? item[borrow]: A float or ctrl

? buffer: Buffer to serialize to

? buffer\_size: Size of the buffer

### Types 0 & 1 ? Positive and negative integers

CBOR has two types of integers ? positive (which may be effectively regarded as unsigned), and negative. There are four possible widths for an integer ? 1, 2, 4, or 8 bytes. These are represented by

enum cbor\_int\_width

Possible widths of CBOR\_TYPE\_UINT items.

Values:

enumerator CBOR\_INT\_8

enumerator CBOR\_INT\_16

enumerator CBOR\_INT\_32

enumerator CBOR\_INT\_64

### Type 0 - positive integers

??

?Corresponding cbor\_type ? CBOR\_TYPE\_UINT ?

??

?Number of allocations ? One per lifetime ?

??

?Storage requirements ? sizeof(cbor\_item\_t) + ?

? ? sizeof(uint\*\_t) ?

??

Note: once a positive integer has been created, its width cannot be changed.

Type 1 - negative integers

??

?Corresponding cbor\_type ? CBOR\_TYPE\_NEGINT ?

??

?Number of allocations ? One per lifetime ?

??

?Storage requirements ? sizeof(cbor\_item\_t) + ?

? ? sizeof(uint\*\_t) ?

??

Note: once a positive integer has been created, its width cannot be changed.

Type 0 & 1

Due to their largely similar semantics, the following functions can be used for both Type 0 and Type 1 items. One can convert between them freely using the conversion functions.

Actual Type of the integer can be checked using item types API.

An integer item is created with one of the four widths. Because integers' storage is bundled together with the handle, the width cannot be changed over its lifetime.

WARNING:

Due to the fact that CBOR negative integers represent integers in the range [-1, -2^N], cbor\_set\_uint API is somewhat counter-intuitive as the resulting logical value is 1 less. This behavior is necessary in order to permit uniform manipulation with the full range of permitted values. For example, the following snippet

```
cbor_item_t * item = cbor_new_int8();
cbor_mark_negint(item);
```

```
cbor_set_uint8(0);
```

will produce an item with the logical value of -1. There is, how?  
ever, an upside to this as well: There is only one representation of  
zero.

### Building new items

```
cbor_item_t *cbor_build_uint8(uint8_t value)
```

Constructs a new positive integer.

Return new positive integer or NULL on memory allocation failure

Parameters

? value: the value to use

```
cbor_item_t *cbor_build_uint16(uint16_t value)
```

Constructs a new positive integer.

Return new positive integer or NULL on memory allocation failure

Parameters

? value: the value to use

```
cbor_item_t *cbor_build_uint32(uint32_t value)
```

Constructs a new positive integer.

Return new positive integer or NULL on memory allocation failure

Parameters

? value: the value to use

```
cbor_item_t *cbor_build_uint64(uint64_t value)
```

Constructs a new positive integer.

Return new positive integer or NULL on memory allocation failure

Parameters

? value: the value to use

### Retrieving values

```
uint8_t cbor_get_uint8(const cbor_item_t *item)
```

Extracts the integer value.

Return the value

Parameters

? item[borrow]: positive or negative integer

```
uint16_t cbor_get_uint16(const cbor_item_t *item)
```

Extracts the integer value.

Return the value

Parameters

? item[borrow]: positive or negative integer

uint32\_t cbor\_get\_uint32(const cbor\_item\_t \*item)

Extracts the integer value.

Return the value

Parameters

? item[borrow]: positive or negative integer

uint64\_t cbor\_get\_uint64(const cbor\_item\_t \*item)

Extracts the integer value.

Return the value

Parameters

? item[borrow]: positive or negative integer

## Setting values

void cbor\_set\_uint8(cbor\_item\_t \*item, uint8\_t value)

Assigns the integer value.

Parameters

? item[borrow]: positive or negative integer item

? value: the value to assign. For negative integer, the

logical value is -value - 1

void cbor\_set\_uint16(cbor\_item\_t \*item, uint16\_t value)

Assigns the integer value.

Parameters

? item[borrow]: positive or negative integer item

? value: the value to assign. For negative integer, the

logical value is -value - 1

void cbor\_set\_uint32(cbor\_item\_t \*item, uint32\_t value)

Assigns the integer value.

Parameters

? item[borrow]: positive or negative integer item

? value: the value to assign. For negative integer, the

logical value is -value - 1

void cbor\_set\_uint64(cbor\_item\_t \*item, uint64\_t value)

Assigns the integer value.

Parameters

? item[borrow]: positive or negative integer item

? value: the value to assign. For negative integer, the logical value is -value - 1

Dealing with width

```
cbor_int_width cbor_int_get_width(const cbor_item_t *item)
```

Queries the integer width.

Return the width

Parameters

? item[borrow]: positive or negative integer item

Dealing with signedness

```
void cbor_mark_uint(cbor_item_t *item)
```

Marks the integer item as a positive integer.

The data value is not changed

Parameters

? item[borrow]: positive or negative integer item

```
void cbor_mark_negint(cbor_item_t *item)
```

Marks the integer item as a negative integer.

The data value is not changed

Parameters

? item[borrow]: positive or negative integer item

Creating new items

```
cbor_item_t *cbor_new_int8()
```

Allocates new integer with 1B width.

The width cannot be changed once allocated

Return new positive integer or NULL on memory allocation fail?

ure. The value is not initialized

```
cbor_item_t *cbor_new_int16()
```

Allocates new integer with 2B width.

The width cannot be changed once allocated

Return new positive integer or NULL on memory allocation fail?

ure. The value is not initialized

`cbor_item_t *cbor_new_int32()`

Allocates new integer with 4B width.

The width cannot be changed once allocated

Return new positive integer or NULL on memory allocation fail?

ure. The value is not initialized

`cbor_item_t *cbor_new_int64()`

Allocates new integer with 8B width.

The width cannot be changed once allocated

Return new positive integer or NULL on memory allocation fail?

ure. The value is not initialized

### Type 2 ? Byte strings

CBOR byte strings are just (ordered) series of bytes without further interpretation (unless there is a tag). Byte string's length may or may not be known during encoding. These two kinds of byte strings can be distinguished using `cbor_bytestring_is_definite()` and `cbor_bytestring_is_indefinite()` respectively.

In case a byte string is indefinite, it is encoded as a series of definite byte strings. These are called "chunks". For example, the encoded item

- 0xf5 Start indefinite byte string
- 0x41 Byte string (1B long)
- 0x00
- 0x41 Byte string (1B long)
- 0xff
- 0xff "Break" control token

represents two bytes, 0x00 and 0xff. This on one hand enables streaming messages even before they are fully generated, but on the other hand it adds more complexity to the client code.

??

### Streaming indefinite byte strings

Please refer to /streaming.

### Getting metadata

size\_t cbor\_bytestring\_length(const cbor\_item\_t \*item)

Returns the length of the binary data.

For definite byte strings only

Return length of the binary data. Zero if no chunk has been at?

tached yet

#### Parameters

? item[borrow]: a definite bytestring

bool cbor\_bytestring\_is\_definite(const cbor\_item\_t \*item)

Is the byte string definite?

Return Is the byte string definite?

#### Parameters

? item[borrow]: a byte string

bool cbor\_bytestring\_is\_indefinite(const cbor\_item\_t \*item)

Is the byte string indefinite?

Return Is the byte string indefinite?

#### Parameters

? item[borrow]: a byte string

size\_t cbor\_bytestring\_chunk\_count(const cbor\_item\_t \*item)

Get the number of chunks this string consist of.

Return The chunk count. 0 for freshly created items.

Parameters

? item[borrow]: A indefinite bytestring

## Reading data

`cbor_mutable_data cbor_bytestring_handle(const cbor_item_t *item)`

Get the handle to the binary data.

Definite items only. Modifying the data is allowed. In that case, the caller takes responsibility for the effect on items this item might be a part of

Return The address of the binary data. NULL if no data have been assigned yet.

Parameters

? item[borrow]: A definite byte string

`cbor_item_t **cbor_bytestring_chunks_handle(const cbor_item_t *item)`

Get the handle to the array of chunks.

Manipulations with the memory block (e.g. sorting it) are allowed, but the validity and the number of chunks must be retained.

Return array of `cbor_bytestring_chunk_count` definite bytestrings

Parameters

? item[borrow]: A indefinite byte string

## Creating new items

`cbor_item_t *cbor_new_definite_bytestring()`

Creates a new definite byte string.

The handle is initialized to NULL and length to 0

Return new definite bytestring. NULL on malloc failure.

`cbor_item_t *cbor_new_indefinite_bytestring()`

Creates a new indefinite byte string.

The chunks array is initialized to NULL and chunkcount to 0

Return new indefinite bytestring. NULL on malloc failure.

## Building items

`cbor_item_t *cbor_build_bytestring(cbor_data handle, size_t length)`

Creates a new byte string and initializes it.

The handle will be copied to a newly allocated block

Return A new byte string with content handle. NULL on malloc failure.

Parameters

? handle: Block of binary data

? length: Length of data

### Manipulating existing items

void cbor\_bytestring\_set\_handle(cbor\_item\_t \*item, cbor\_mutable\_data data, size\_t length)

Set the handle to the binary data.

Parameters

? item[borrow]: A definite byte string

? data: The memory block. The caller gives up the ownership of the block. libcbor will deallocate it when appropriate using its free function

? length: Length of the data block

bool cbor\_bytestring\_add\_chunk(cbor\_item\_t \*item, cbor\_item\_t \*chunk)

Appends a chunk to the bytestring.

Indefinite byte strings only.

May realloc the chunk storage.

Return true on success, false on realloc failure. In that case, the refcount of chunk is not increased and the item is left intact.

Parameters

? item[borrow]: An indefinite byte string

? item[incref]: A definite byte string

### Type 3 ? UTF-8 strings

CBOR strings work in much the same ways as type\_2.

??

?Corresponding cbor\_type ? CBOR\_TYPE\_STRING ?

??

?Number of allocations ? One plus any manipulations ?

?(definite) ? with the data ?

??

?Number of allocations (in? ? One plus logarithmically ?

? ? tive to chunk count ?

??

?Storage requirements (def? ? sizeof(cbor\_item\_t) + ?

?inite) ? length(handle) ?

??

?Storage requirements (in? ? sizeof(cbor\_item\_t) \* (1 + ?

?definite) ? chunk\_count) + chunks ?

??

### Streaming indefinite strings

Please refer to /streaming.

### UTF-8 encoding validation

libcbor considers UTF-8 encoding validity to be a part of the well-formedness notion of CBOR and therefore invalid UTF-8 strings will be rejected by the parser. Strings created by the user are not checked.

### Getting metadata

size\_t cbor\_string\_length(const cbor\_item\_t \*item)

Returns the length of the underlying string.

For definite strings only

Return length of the string. Zero if no chunk has been attached

yet

Parameters

? item[borrow]: a definite string

bool cbor\_string\_is\_definite(const cbor\_item\_t \*item)

Is the string definite?

Return Is the string definite?

Parameters

? item[borrow]: a string

bool cbor\_string\_is\_indefinite(const cbor\_item\_t \*item)

Is the string indefinite?

Return Is the string indefinite?

## Parameters

? item[borrow]: a string

size\_t cbor\_string\_chunk\_count(const cbor\_item\_t \*item)

Get the number of chunks this string consist of.

Return The chunk count. 0 for freshly created items.

## Parameters

? item[borrow]: A indefinite string

## Reading data

cbor\_mutable\_data cbor\_string\_handle(const cbor\_item\_t \*item)

Get the handle to the underlying string.

Definite items only. Modifying the data is allowed. In that case, the caller takes responsibility for the effect on items this item might be a part of

Return The address of the underlying string. NULL if no data have been assigned yet.

## Parameters

? item[borrow]: A definite string

cbor\_item\_t \*\*cbor\_string\_chunks\_handle(const cbor\_item\_t \*item)

Get the handle to the array of chunks.

Manipulations with the memory block (e.g. sorting it) are allowed, but the validity and the number of chunks must be retained.

Return array of cbor\_string\_chunk\_count definite strings

## Parameters

? item[borrow]: A indefinite string

## Creating new items

cbor\_item\_t \*cbor\_new\_definite\_string()

Creates a new definite string.

The handle is initialized to NULL and length to 0

Return new definite string. NULL on malloc failure.

cbor\_item\_t \*cbor\_new\_indefinite\_string()

Creates a new indefinite string.

The chunks array is initialized to NULL and chunkcount to 0

Return new indefinite string. NULL on malloc failure.

## Building items

```
cbor_item_t *cbor_build_string(const char *val)
```

Creates a new string and initializes it.

The val will be copied to a newly allocated block

Return A new string with content handle. NULL on malloc failure.

### Parameters

? val: A null-terminated UTF-8 string

## Manipulating existing items

```
void cbor_string_set_handle(cbor_item_t *item, cbor_mutable_data data,  
size_t length)
```

Set the handle to the underlying string.

### WARNING:

Using a pointer to a stack allocated constant is a common mistake. Lifetime of the string will expire when it goes out of scope and the CBOR item will be left inconsistent.

### Parameters

? item[borrow]: A definite string

? data: The memory block. The caller gives up the owner?

ship of the block. libcbor will deallocate it when ap?

propriate using its free function

? length: Length of the data block

```
bool cbor_string_add_chunk(cbor_item_t *item, cbor_item_t *chunk)
```

Appends a chunk to the string.

Indefinite strings only.

May realloc the chunk storage.

Return true on success. false on realloc failure. In that case,

the refcount of chunk is not increased and the item is

left intact.

### Parameters

? item[borrow]: An indefinite string

? item[incref]: A definite string

CBOR arrays, just like byte strings and strings, can be encoded either as definite, or as indefinite.

??  
?Corresponding cbor\_type ? CBOR\_TYPE\_ARRAY ?  
??  
?Number of allocations ? Two plus any manipulations ?

Examples

- 0x9f Start indefinite array
- 0x01 Unsigned integer 1
- 0xff "Break" control token
- 0x9f Start array, 1B length follows
- 0x20 Unsigned integer 32
- ... 32 items follow

Streaming indefinite arrays

Please refer to /streaming.

Getting metadata

```
size_t cbor_array_size(const cbor_item_t *item)
```

Get the number of members.

Return The number of members

Parameters

? item[borrow]: An array

size\_t cbor\_array\_allocated(const cbor\_item\_t \*item)

Get the size of the allocated storage.

Return The size of the allocated storage (number of items)

Parameters

? item[borrow]: An array

bool cbor\_array\_is\_definite(const cbor\_item\_t \*item)

Is the array definite?

Return Is the array definite?

Parameters

? item[borrow]: An array

bool cbor\_array\_is\_indefinite(const cbor\_item\_t \*item)

Is the array indefinite?

Return Is the array indefinite?

Parameters

? item[borrow]: An array

## Reading data

cbor\_item\_t \*\*cbor\_array\_handle(const cbor\_item\_t \*item)

Get the array contents.

The items may be reordered and modified as long as references remain consistent.

Return cbor\_array\_size items

Parameters

? item[borrow]: An array

cbor\_item\_t \*cbor\_array\_get(const cbor\_item\_t \*item, size\_t index)

Get item by index.

Return incref The item, or NULL in case of boundary violation

Parameters

? item[borrow]: An array

? index: The index

## Creating new items

cbor\_item\_t \*cbor\_new\_definite\_array(size\_t size)

Create new definite array.

Return new array or NULL upon malloc failure

Parameters

? size: Number of slots to preallocate

`cbor_item_t *cbor_new_indefinite_array()`

Create new indefinite array.

Return new array or NULL upon malloc failure

## Modifying items

`bool cbor_array_push(cbor_item_t *array, cbor_item_t *pushee)`

Append to the end.

For indefinite items, storage may be reallocated. For definite items, only the preallocated capacity is available.

Return true on success, false on failure

Parameters

? array[borrow]: An array

? pushee[incref]: The item to push

`bool cbor_array_replace(cbor_item_t *item, size_t index, cbor_item_t *value)`

Replace item at an index.

The item being replace will be `cbor_decref`'ed.

Return true on success, false on allocation failure.

Parameters

? item[borrow]: An array

? value[incref]: The item to assign

? index: The index, first item is 0.

`bool cbor_array_set(cbor_item_t *item, size_t index, cbor_item_t *value)`

Set item by index.

Creating arrays with holes is not possible

Return true on success, false on allocation failure.

Parameters

? item[borrow]: An array

? value[incref]: The item to assign

? index: The index, first item is 0.

## Type 5 ? Maps

CBOR maps are the plain old associate hash maps known from JSON and many other formats and languages, with one exception: any CBOR data item can be a key, not just strings. This is somewhat unusual and you, as an application developer, should keep that in mind.

Maps can be either definite or indefinite, in much the same way as type\_4.

??

?Corresponding cbor\_type ? CBOR\_TYPE\_MAP ?

??

?Number of allocations ? Two plus any manipulations ?

?(definite) ? with the data ?

?Storage requirements (in? ? <= sizeof(cbor\_item\_t) + ?

?definite) ? sizeof(cbor\_pair) \* size \* ?

? ? BUFFER\_GROWTH ?

??

## Streaming maps

Please refer to /streaming.

## Getting metadata

size\_t cbor\_map\_size(const cbor\_item\_t \*item)

Get the number of pairs.

Return The number of pairs

Parameters

? item[borrow]: A map

size\_t cbor\_map\_allocated(const cbor\_item\_t \*item)

Get the size of the allocated storage.

Return Allocated storage size (as the number of cbor\_pair items)

Parameters

? item[borrow]: A map

bool cbor\_map\_is\_definite(const cbor\_item\_t \*item)

Is this map definite?

Return Is this map definite?

Parameters

? item[borrow]: A map

bool cbor\_map\_is\_indefinite(const cbor\_item\_t \*item)

Is this map indefinite?

Return Is this map indefinite?

Parameters

? item[borrow]: A map

Reading data

struct cbor\_pair \*cbor\_map\_handle(const cbor\_item\_t \*item)

Get the pairs storage.

Return Array of cbor\_map\_size pairs. Manipulation is possible as

long as references remain valid.

Parameters

? item[borrow]: A map

Creating new items

cbor\_item\_t \*cbor\_new\_definite\_map(size\_t size)

Create a new definite map.

Return new definite map. NULL on malloc failure.

Parameters

? size: The number of slots to preallocate

cbor\_item\_t \*cbor\_new\_indefinite\_map()

Create a new indefinite map.

Return new definite map. NULL on malloc failure.

Parameters

? size: The number of slots to preallocate

Modifying items

bool cbor\_map\_add(cbor\_item\_t \*item, struct cbor\_pair pair)

Add a pair to the map.

For definite maps, items can only be added to the preallocated space. For indefinite maps, the storage will be expanded as needed

Return true on success, false if either reallocation failed or the preallocated storage is full

Parameters

? item[borrow]: A map

? pair[incref]: The key-value pair to add (incref is member-wise)

### Type 6 ? Semantic tags

Tag are additional metadata that can be used to extend or specialize the meaning or interpretation of the other data items.

For example, one might tag an array of numbers to communicate that it should be interpreted as a vector.

Please consult the official IANA repository of CBOR tags before inventing new ones.

??

?Corresponding cbor\_type ? CBOR\_TYPE\_TAG ?

??

?Number of allocations ? One plus any manipulations ?

? ? with the data reallocation ?

? ? tions relative to chunk ?

? ? count ?

??

?Storage requirements ? sizeof(cbor\_item\_t) + the ?

? ? tagged item ?

??

cbor\_item\_t \*cbor\_new\_tag(uint64\_t value)

Create a new tag.

Return new tag. Item reference is NULL. Returns NULL upon memory allocation failure

## Parameters

? value: The tag value. Please consult the tag repository

```
cbor_item_t *cbor_tag_item(const cbor_item_t *item)
```

Get the tagged item.

Return incref the tagged item

## Parameters

? item[borrow]: A tag

```
uint64_t cbor_tag_value(const cbor_item_t *item)
```

Get tag value.

Return The tag value. Please consult the tag repository

## Parameters

? item[borrow]: A tag

```
void cbor_tag_set_item(cbor_item_t *item, cbor_item_t *tagged_item)
```

Set the tagged item.

## Parameters

? item[borrow]: A tag

? tagged\_item[incref]: The item to tag

## Type 7 ? Floats & control tokens

This type combines two completely unrelated types of items -- floating point numbers and special values such as true, false, null, etc. We refer to these special values as 'control values' or 'ctrls' for short throughout the code.

Just like integers, they have different possible width (resulting in different value ranges and precisions).

```
enum cbor_float_width
```

Possible widths of CBOR\_TYPE\_FLOAT\_CTRL items.

Values:

```
enumerator CBOR_FLOAT_0
```

Internal use - ctrl and special values.

```
enumerator CBOR_FLOAT_16
```

Half float.

```
enumerator CBOR_FLOAT_32
```

Single float.

enumerator CBOR\_FLOAT\_64

Double.

??

?Corresponding cbor\_type ? CBOR\_TYPE\_FLOAT\_CTRL ?

??

?Number of allocations ? One per lifetime ?

??

?Storage requirements ? sizeof(cbor\_item\_t) + ?

? ? 1/4/8 ?

??

Getting metadata

bool cbor\_float\_ctrl\_is\_ctrl(const cbor\_item\_t \*item)

Is this a ctrl value?

Return Is this a ctrl value?

Parameters

? item[borrow]: A float or ctrl item

cbor\_float\_width cbor\_float\_get\_width(const cbor\_item\_t \*item)

Get the float width.

Return The width.

Parameters

? item[borrow]: A float or ctrl item

Reading data

float cbor\_float\_get\_float2(const cbor\_item\_t \*item)

Get a half precision float.

The item must have the corresponding width

Return half precision value

Parameters

? [borrow]: A half precision float

float cbor\_float\_get\_float4(const cbor\_item\_t \*item)

Get a single precision float.

The item must have the corresponding width

Return single precision value

Parameters

? [borrow]: A single precision float

double cbor\_float\_get\_float8(const cbor\_item\_t \*item)

Get a double precision float.

The item must have the corresponding width

Return double precision value

Parameters

? [borrow]: A double precision float

double cbor\_float\_get\_float(const cbor\_item\_t \*item)

Get the float value represented as double.

Can be used regardless of the width.

Return double precision value

Parameters

? [borrow]: Any float

uint8\_t cbor\_ctrl\_value(const cbor\_item\_t \*item)

Reads the control value.

Return the simple value

Parameters

? item[borrow]: A ctrl item

bool cbor\_get\_bool(const cbor\_item\_t \*item)

Get value from a boolean ctrl item.

Return boolean value

Parameters

? item[borrow]: A ctrl item

Creating new items

cbor\_item\_t \*cbor\_new\_ctrl()

Constructs a new ctrl item.

The width cannot be changed once the item is created

Return new 1B ctrl or NULL upon memory allocation failure

cbor\_item\_t \*cbor\_new\_float2()

Constructs a new float item.

The width cannot be changed once the item is created

Return new 2B float or NULL upon memory allocation failure

cbor\_item\_t \*cbor\_new\_float4()

Constructs a new float item.

The width cannot be changed once the item is created

Return new 4B float or NULL upon memory allocation failure

```
cbor_item_t *cbor_new_float8()
```

Constructs a new float item.

The width cannot be changed once the item is created

Return new 8B float or NULL upon memory allocation failure

```
cbor_item_t *cbor_new_null()
```

Constructs new null ctrl item.

Return new null ctrl item or NULL upon memory allocation failure

```
cbor_item_t *cbor_new_undef()
```

Constructs new undef ctrl item.

Return new undef ctrl item or NULL upon memory allocation failure

ure

#### Building items

```
cbor_item_t *cbor_build_bool(bool value)
```

Constructs new boolean ctrl item.

Return new boolean ctrl item or NULL upon memory allocation failure

ure

#### Parameters

? value: The value to use

```
cbor_item_t *cbor_build_ctrl(uint8_t value)
```

Constructs a ctrl item.

Return new ctrl item or NULL upon memory allocation failure

#### Parameters

? value: the value to use

```
cbor_item_t *cbor_build_float2(float value)
```

Constructs a new float.

Return new float

#### Parameters

? value: the value to use

```
cbor_item_t *cbor_build_float4(float value)
```

Constructs a new float.

Return new float or NULL upon memory allocation failure

Parameters

? value: the value to use

`cbor_item_t *cbor_build_float8(double value)`

Constructs a new float.

Return new float or NULL upon memory allocation failure

Parameters

? value: the value to use

Manipulating existing items

`void cbor_set_ctrl(cbor_item_t *item, uint8_t value)`

Assign a control value.

WARNING:

It is possible to produce an invalid CBOR value by assigning

a

invalid value using this mechanism. Please consult the standard

before use.

Parameters

? item[`borrow`]: A ctrl item

? value: The simple value to assign. Please consult the

standard for allowed values

`void cbor_set_bool(cbor_item_t *item, bool value)`

Assign a boolean value to a boolean ctrl item.

Parameters

? item[`borrow`]: A ctrl item

? value: The simple value to assign.

`void cbor_set_float2(cbor_item_t *item, float value)`

Assigns a float value.

Parameters

? item[`borrow`]: A half precision float

? value: The value to assign

`void cbor_set_float4(cbor_item_t *item, float value)`

Assigns a float value.

Parameters

? item[borrow]: A single precision float

? value: The value to assign

```
void cbor_set_float8(cbor_item_t *item, double value)
```

Assigns a float value.

Parameters

? item[borrow]: A double precision float

? value: The value to assign

## Half floats

CBOR supports two bytes wide ("half-precision") floats which are not supported by the C language. libcbor represents them using float [values](https://en.cppreference.com/w/c/language/type) throughout the API, which has important implications when manipulating these values. In particular, if a user uses some of the manipulation APIs (e.g. `cbor_set_float2()`, `cbor_new_float2()`) to introduce a value that doesn't have an exact half-float representation, the encoding semantics are given by `cbor_encode_half()` as follows:

```
size_t cbor_encode_half(float value, unsigned char *buffer, size_t buffer_size)
```

Encodes a half-precision float.

Since there is no native representation or semantics for half floats in the language, we use single-precision floats, as every value that can be expressed as a half-float can also be expressed as a float.

This however means that not all floats passed to this function can be unambiguously encoded. The behavior is as follows:

### 7.0

? Infinity, NaN are preserved

? Zero is preserved

? Denormalized numbers keep their sign bit and 10 most significant bit of the significand

? All other numbers.

? If the logical value of the exponent is < -24, the output is zero

? If the logical value of the exponent is between -23 and -14, the out?

put is cut off to represent the 'magnitude' of the input, by which we mean  $(-1)^{\text{signbit}} \times 1.0e^{\text{exponent}}$ . The value in the significand is lost.

? In all other cases, the sign bit, the exponent, and 10 most significant bits of the significand are kept

Return number of bytes written

Parameters

? value:

? buffer: Target buffer

? buffer\_size: Available space in the buffer

[1] <http://softwareengineering.vazexqi.com/files/pattern.html>

## Streaming & indefinite items

CBOR strings, byte strings, arrays, and maps can be encoded as indefinite, meaning their length or size is not specified. Instead, they are divided into chunks (strings, byte strings), or explicitly terminated (arrays, maps).

This is one of the most important (and due to poor implementations, underutilized) features of CBOR. It enables low-overhead streaming just about anywhere without dealing with channels or pub/sub mechanism. It is, however, important to recognize that CBOR streaming is not a substitute for Websockets [1] and similar technologies.

[1] RFC 6455

## Decoding

Another way to decode data using libcbor is to specify a callback that will be invoked when upon finding certain items in the input. This service is provided by

```
struct cbor_decoder_result cbor_stream_decode(cbor_data buffer, size_t buffer_size, const struct cbor_callbacks *callbacks, void *context)
```

Stateless decoder.

Will try parsing the buffer and will invoke the appropriate callback on success. Decodes one item at a time. No memory allocations occur.

Parameters

? buffer: Input buffer

? buffer\_size: Length of the buffer

? callbacks: The callback bundle

? context: An arbitrary pointer to allow for maintaining context.

To get started, you might want to have a look at the simple streaming example:

```
#include "cbor.h"

#include <stdio.h>

#include <string.h>

/*
 * Illustrates how one might skim through a map (which is assumed to have
 * string keys and values only), looking for the value of a specific key
 *
 * Use the examples/data/map.cbor input to test this.
 */

const char * key = "a secret key";

bool key_found = false;

void find_string(void * _ctx, cbor_data buffer, size_t len)
{
    if (key_found) {
        printf("Found the value: %*s\n", (int) len, buffer);
        key_found = false;
    } else if (len == strlen(key)) {
        key_found = (memcmp(key, buffer, len) == 0);
    }
}

int main(int argc, char * argv[])
{
    FILE * f = fopen(argv[1], "rb");
    fseek(f, 0, SEEK_END);
    size_t length = (size_t)ftell(f);
    fseek(f, 0, SEEK_SET);
```

```

unsigned char * buffer = malloc(length);
fread(buffer, length, 1, f);
struct cbor_callbacks callbacks = cbor_empty_callbacks;
struct cbor_decoder_result decode_result;
size_t bytes_read = 0;
callbacks.string = find_string;
while (bytes_read < length) {
    decode_result = cbor_stream_decode(buffer + bytes_read,
                                      length - bytes_read,
                                      &callbacks, NULL);

    bytes_read += decode_result.read;
}
free(buffer);
fclose(f);
}

```

The callbacks are defined by

```
struct cbor_callbacks
```

Callback bundle passed to the decoder.

Public Members

```
cbor_int8_callback uint8
```

Unsigned int.

```
cbor_int16_callback uint16
```

Unsigned int.

```
cbor_int32_callback uint32
```

Unsigned int.

```
cbor_int64_callback uint64
```

Unsigned int.

```
cbor_int64_callback negint64
```

Negative int.

```
cbor_int32_callback negint32
```

Negative int.

```
cbor_int16_callback negint16
```

Negative int.

cbor\_int8\_callback negint8

Negative int.

cbor\_simple\_callback byte\_string\_start

Definite byte string.

cbor\_string\_callback byte\_string

Indefinite byte string start.

cbor\_string\_callback string

Definite string.

cbor\_simple\_callback string\_start

Indefinite string start.

cbor\_simple\_callback indef\_array\_start

Definite array.

cbor\_collection\_callback array\_start

Indefinite array.

cbor\_simple\_callback indef\_map\_start

Definite map.

cbor\_collection\_callback map\_start

Indefinite map.

cbor\_int64\_callback tag

Tags.

cbor\_float\_callback float2

Half float.

cbor\_float\_callback float4

Single float.

cbor\_double\_callback float8

Double float.

cbor\_simple\_callback undefined

Undef.

cbor\_simple\_callback null

Null.

cbor\_bool\_callback boolean

Bool.

cbor\_simple\_callback indef\_break

Indefinite item break.

When building custom sets of callbacks, feel free to start from

```
const struct cbor_callbacks cbor_empty_callbacks
```

Dummy callback bundle - does nothing.

#### Related structures

```
enum cbor_decoder_status
```

Streaming decoder result - status.

Values:

```
enumerator CBOR_DECODER_FINISHED
```

OK, finished.

```
enumerator CBOR_DECODER_NEDATA
```

Not enough data - mismatch with MTB.

```
enumerator CBOR_DECODER_EBUFFER
```

Buffer manipulation problem.

```
enumerator CBOR_DECODER_ERROR
```

Malformed or reserved MTB/value.

```
struct cbor_decoder_result
```

Streaming decoder result.

Public Members

```
size_t read
```

Bytes read.

```
enum cbor_decoder_status status
```

The result.

```
size_t required
```

When status == CBOR\_DECODER\_NEDATA, the minimum number of bytes required to continue parsing.

#### Callback types definition

```
typedef void (*cbor_int8_callback)(void*, uint8_t)
```

Callback prototype.

```
typedef void (*cbor_int16_callback)(void*, uint16_t)
```

Callback prototype.

```
typedef void (*cbor_int32_callback)(void*, uint32_t)
```

Callback prototype.

```
typedef void (*cbor_int64_callback)(void*, uint64_t)
```

Callback prototype.

```
typedef void (*cbor_simple_callback)(void*)
```

Callback prototype.

```
typedef void (*cbor_string_callback)(void*, cbor_data, size_t)
```

Callback prototype.

```
typedef void (*cbor_collection_callback)(void*, size_t)
```

Callback prototype.

```
typedef void (*cbor_float_callback)(void*, float)
```

Callback prototype.

```
typedef void (*cbor_double_callback)(void*, double)
```

Callback prototype.

```
typedef void (*cbor_bool_callback)(void*, bool)
```

Callback prototype.

## Encoding

TODO

## Tests

### Unit tests

There is a comprehensive test suite employing CMocka. You can run all of them using ctest in the build directory. Individual tests are themselves runnable. Please refer to CTest documentation for detailed information on how to specify particular subset of tests.

### Testing for memory leaks

Every release is tested for memory correctness. You can run these tests by passing the -T memcheck flag to ctest. [1]

[1] Project should be configured with -DCMAKE\_BUILD\_TYPE=Debug to obtain meaningful description of location of the leak. You might also need --dsymutil=yes on OS X.

### Code coverage

Every release is inspected using GCOV/LCOV. Platform-independent code should be fully covered by the test suite. Simply run

```
make coverage
```

or alternatively run lcov by hand using

```
lcov --capture --directory . --output-file coverage.info
```

```
genhtml coverage.info --output-directory out
```

## Fuzz testing

Every release is tested using a fuzz test. In this test, a huge buffer filled with random data is passed to the decoder. We require that it either succeeds or fail with a sensible error, without leaking any memory. This is intended to simulate real-world situations where data received from the network are CBOR-decoded before any further processing.

## RFC conformance

libcbor is, generally speaking, very faithful implementation of RFC 7049. There are, however, some limitations imposed by technical constraints.

## Bytestring length

There is no explicit limitation of indefinite length byte strings. [1] libcbor will not handle byte strings with more chunks than the maximum value of `size_t`. On any sane platform, such string would not fit in the memory anyway. It is, however, possible to process arbitrarily long strings and byte strings using the streaming decoder.

[1] <http://tools.ietf.org/html/rfc7049#section-2.2.2>

## Half-precision IEEE 754 floats

As of C99 and even C11, there is no standard implementation for 2 bytes floats. libcbor packs them as a float <https://en.cppreference.com/w/c/language/type>. When encoding, libcbor selects the appropriate wire representation based on metadata and the actual value. This applies both to canonical and normal mode.

For more information on half-float serialization, please refer to the section on `api_type_7_hard_floats`.

## Internal mechanics

Internal workings of libcbor are mostly derived from the specification. The purpose of this document is to describe technical choices made during design & implementation and to explicate the reasoning behind those choices.

## Terminology

? allow proper handling of (streamed) data bigger than available memory

[1] Reasonable handling of DSTs requires reallocation if the API is to remain sane.

### Coding style

This code loosely follows the Linux kernel coding style. Tabs are tabs, and they are 4 characters wide.

### Memory layout

CBOR is very dynamic in the sense that it contains many data elements of variable length, sometimes even indefinite length. This section describes internal representation of all CBOR data types.

Generally speaking, data items consist of three parts:

- ? a generic handle,
- ? the associated metadata,
- ? and the actual data

type cbor\_item\_t

Represents the item. Used as an opaque type

cbor\_type type

Type discriminator

size\_t refcount

Reference counter. Used by cbor\_decref(), cbor\_incref()

union cbor\_item\_metadata metadata

Union discriminated by type. Contains type-specific meta?

data

unsigned char \*data

Contains pointer to the actual data. Small, fixed size items (api/type\_0\_1, api/type\_6, api/type\_7) are allocated as a single memory block.

Consider the following snippet

```
cbor_item_t * item = cbor_new_int8();
```

then the memory is laid out as follows

Dynamically sized types (api/type\_2, api/type\_3, api/type\_4, api/type\_5) may store handle and data in separate locations. This enables creating large items (e.g. byte strings) without realloc() or copying large blocks of memory. One simply attaches the correct pointer to the handle.

#### type cbor\_item\_metadata

Union type of the following members, based on the item type:

struct \_cbor\_int\_metadata int\_metadata

Used both by both api/type\_0\_1

struct \_cbor\_bytestring\_metadata bytestring\_metadata

struct \_cbor\_string\_metadata string\_metadata

struct \_cbor\_array\_metadata array\_metadata

struct \_cbor\_map\_metadata map\_metadata

struct \_cbor\_tag\_metadata tag\_metadata

struct \_cbor\_float\_ctrl\_metadata float\_ctrl\_metadata

#### Decoding

As outlined in api, there decoding is based on the streaming decoder. Essentially, the decoder is a custom set of callbacks for the streaming decoder.

#### Changelog

##### Next

0.7.0 (2020-04-25)

?

Fix bad encoding of NaN half-floats [[Fixes #53]](?)

<https://github.com/PJK/libcbor/issues/53> (discovered by

[BSipos-RKF](<https://github.com/BSipos-RKF>))

? Warning: Previous versions encoded NaNs as 0xf9e700 instead of 0xf97e00; if you rely on the broken behavior, this will be a breaking change

? Fix potentially bad encoding of negative half-float with exponent < -14 [[Fixes #112]](<https://github.com/PJK/libcbor/issues/112>) (discussed by [yami36](<https://github.com/yami36>))

?

BREAKING: Improved bool support [[Fixes #63]](<https://github.com/PJK/libcbor/issues/63>)

? Rename `cbor_ctrl_is_bool` to `cbor_get_bool` and fix the behavior

? Add `cbor_set_bool`

? Fix `memory_allocation_test` breaking the build without `CBOR_CUSTOM_ALLOC`

LOC [[Fixes #128]](<https://github.com/PJK/libcbor/issues/128>) (by [panlinux](<https://github.com/panlinux>))

? [Fix a potential build issue where `cJSON` includes may be misconfigured](<https://github.com/PJK/libcbor/pull/132>)

?

Breaking: [Add a limit on the size of the decoding context stack](<https://github.com/PJK/libcbor/pull/138>) (by [James-ZHANG](<https://github.com/James-ZHANG>))

? If your usecase requires parsing very deeply nested structures, you might need to increase the default 2k limit via `CBOR_MAX_STACK_SIZE`

?

Enable LTO/IPO based on [CheckIPOSUPPORTED](<https://cmake.org/cmake/help/latest/module/CheckIPOSUPPORTED.html#module:CheckIPOSUPPORTED>)

ported.html#module:CheckIPOSUPPORTED) [[#143]](<https://github.com/PJK/libcbor/pull/143>) (by [xanderlent](<https://github.com/xanderlent>))

? If you rely on LTO being enabled and use CMake version older than 3.9, you will need to re-enable it manually or upgrade your CMake

## 0.6.1 (2020-03-26)

?

[Fix bad shared library version number](?

<https://github.com/PJK/libcbor/pull/131>)

? Warning: Shared library built from the 0.6.0 release is erroneously marked as version "0.6.0", which makes it incompatible with future releases including the v0.6.X line even though they may be compatible API/ABI-wise. Refer to the documentation for the new SO versioning scheme.

## 0.6.0 (2020-03-15)

?

Correctly set .so version [[Fixes #52]](?]

<https://github.com/PJK/libcbor/issues/52>).

? Warning: All previous releases will be identified as 0.0 by the linker.

? Fix & prevent heap overflow error in example code [[#74]](?]

<https://github.com/PJK/libcbor/pull/74>) [[#76]](?]

<https://github.com/PJK/libcbor/pull/76>) (by @nevun)

? Correctly set OSX dynamic library version [[Fixes #75]](?]

<https://github.com/PJK/libcbor/issues/75>)

? [Fix misplaced 0xFF bytes in maps possibly causing memory corruption](<https://github.com/PJK/libcbor/pull/82>)

? BREAKING: Fix handling & cleanup of failed memory allocation in constructor and builder helper functions [[Fixes #84]](?]

<https://github.com/PJK/libcbor/issues/84>) - All `cbor_new_*` and `cbor_build_*` functions will now explicitly return NULL when memory allocation fails - It is up to the client to handle such cases

? Globally enforced code style [[Fixes #83]](?]

<https://github.com/PJK/libcbor/issues/83>)

? Fix issue possible memory corruption bug on repeated `cbor_(byte|string)_add_chunk` calls with intermittently failing `realloc` calls

? Fix possibly misaligned reads and writes when `endian.h` is used or

when running on a big-endian machine [\[\[Fixes #99\]\]](#)(?)

<https://github.com/PJK/libcbor/issues/99>, [\[#100\]](#)(?)

<https://github.com/PJK/libcbor/issues/100>]

? [\[Improved CI setup with Travis-native arm64 support\]](#)(?)

<https://github.com/PJK/libcbor/pull/116>)

? [\[Docs migrated to Sphinx 2.4 and Python3\]](#)(?)

<https://github.com/PJK/libcbor/pull/117>)

#### 0.5.0 (2017-02-06)

? Remove cmocka from the subtree (always rely on system or user-provided version)

? Windows CI

? Only build tests if explicitly enabled (-DWITH\_TESTS=ON)

? Fixed static header declarations (by cedric-d)

? Improved documentation (by Michael Richardson)

? Improved examples/readfile.c

? Reworked (re)allocation to handle huge inputs and overflows in size\_t

[\[\[Fixes #16\]\]](#)(<https://github.com/PJK/libcbor/issues/16>)

? Improvements to C++ linkage (corrected cbor\_empty\_callbacks, fixed restrict pointers) (by Dennis Bijwaard)

? Fixed Linux installation directory depending on architecture [\[\[Fixes #34\]\]](#)(<https://github.com/PJK/libcbor/issues/34>) (by jvymazal)

? Improved 32-bit support [\[\[Fixes #35\]\]](#)(?)

<https://github.com/PJK/libcbor/issues/35>)

? Fixed MSVC compatibility [\[\[Fixes #31\]\]](#)(?)

<https://github.com/PJK/libcbor/issues/31>)

? Fixed and improved half-float encoding [\[\[Fixes #5\]\]](#)(?)

<https://github.com/PJK/libcbor/issues/5>, [\[#11\]](#)(?)

<https://github.com/PJK/libcbor/issues/11>]

#### 0.4.0 (2015-12-25)

Breaks build & header compatibility due to:

? Improved build configuration and feature check macros

? Endianess configuration fixes (by Erwin Kroon and David Grigsby)

? pkg-config compatibility (by Vincent Bernat)

? enable use of versioned SONAME (by Vincent Bernat)

? better fuzzer (wasn't random until now, ooops)

### 0.3.1 (2015-05-21)

? documentation and comments improvements, mostly for the API reference

### 0.3.0 (2015-05-21)

? Fixes, polishing, niceties across the code base

? Updated examples

? cbor\_copy

? cbor\_build\_negint8, 16, 32, 64, matching asserts

? cbor\_build\_stringn

? cbor\_build\_tag

? cbor\_build\_float2, ...

### 0.2.1 (2015-05-17)

? C99 support

### 0.2.0 (2015-05-17)

? cbor\_ctrl\_bool -> cbor\_ctrl\_is\_bool

? Added cbor\_array\_allocated & map equivalent

? Overhauled endianness conversion - ARM now works as expected

? 'sort.c' example added

? Significantly improved and doxyfied documentation

### 0.1.0 (2015-05-06)

The initial release, yay!

## Development

### Vision and principles

Consistency and coherence are one of the key characteristics of good software. While the reality is never black and white, it is important libcbor contributors are working towards the same high-level goal. This document attempts to set out the basic principles of libcbor and the rationale behind them. If you are contributing to libcbor or looking to evaluate whether libcbor is the right choice for your project, it might be worthwhile to skim through the section below.

### Mission statement

libcbor is the compact, full-featured, and safe CBOR library that works

everywhere.

## Goals

### RFC-conformance and full feature support

Anything the standard allows, libcbor can do.

Why? Because conformance and interoperability is the point of defining standards. Clients expect the support to be feature-complete and there is no significant complexity reduction that can be achieved by slightly cutting corners, which means that the incremental cost of full RFC support is comparatively small over "almost-conformance" seen in many alternatives.

### Safety

Untrusted bytes from the network are the typical input.

Why? Because it is the client expectation. Vast majority of security vulnerabilities are violations of contracts -- in other words, bugs -- anyway.

### Self-containment

libcbor has no runtime dependencies.

Why? Because any constraint imposed on libcbor has to be enforced transitively, which is difficult and leads to incompatibilities and distribution issues, especially in IoT applications.

### Portability

If you can compile C for it, libcbor will work there.

Why? Lowest-common-denominator solution for system-level and IoT software was the original niche of libcbor. Users who rely on libcbor expect future updates to work on their target platform.

### Stable and predictable API

libcbor will not break without a warning.

Why? Industry-standard versioning is a basic requirement for production-quality software. This is especially relevant in IoT environments where updates may be costly.

### Performance

libcbor is fast and resource-efficient by design

Why? Because the main maintainer is an avid hater of slow bloated software

ware. Who wouldn't want more bang per their electricity buck?

## Non-goals

- ? Convenience -- libcbor only provides the minimum surface to make it usable
- ? FFI/SWIG/interop support -- libcbor is primarily a C library for C clients
- ? One-off usecases support -- although there are primitives to reuse, the basic assumption is that most clients want most of CBOR features

## Development dependencies

- ? CMocka (testing)
- ? Python and pip (Sphinx platform)
- ? Doxygen
- ? Sphinx (documentation)
- ? There are some Ruby scripts in misc
- ? Valgrind (memory correctness & profiling)
- ? GCOV/LCOV (test coverage)
- ? clang-format

## Installing sphinx

```
pip install sphinx
pip install sphinx_rtd_theme
pip install breathe
pip install https://github.com/lepture/python-livereload/archive/master.zip
pip install sphinx-autobuild
```

Further instructions on configuring advanced features can be found at <http://read-the-docs.readthedocs.org/en/latest/install.html>.

## Live preview of docs

```
cd doc
make livehtml
```

## Set up git hooks

A catch-all git hook that runs clang-format and automatically refreshes the GH pages contents located in docs can be symlinked:

```
In -sf $(pwd)/misc/hooks/pre-commit .git/hooks
```

Testing and code coverage

Please refer to tests
