## **Red Hat Enterprise Linux Release 9.2 Manual Pages on 'move\_pages.2' command**

**\$ man move\_pages.2**

MOVE\_PAGES(2)          Linux Programmer's Manual          MOVE\_PAGES(2)

NAME

move\_pages - move individual pages of a process to another node

SYNOPSIS

```
#include <numaif.h>

long move_pages(int pid, unsigned long count, void **pages,
                const int *nodes, int *status, int flags);
```

Link with -lnuma.

DESCRIPTION

move\_pages() moves the specified pages of the process pid to the memory nodes specified by nodes. The result of the move is reflected in status. The flags indicate constraints on the pages to be moved. pid is the ID of the process in which pages are to be moved. If pid is 0, then move\_pages() moves pages of the calling process.

To move pages in another process requires the following privileges:

- \* In kernels up to and including Linux 4.12: the caller must be privileged (CAP\_SYS\_NICE) or the real or effective user ID of the calling process must match the real or saved-set user ID of the target process.
- \* The older rules allowed the caller to discover various address choices made by the kernel that could lead to the defeat of address-space-layout randomization for a process owned by the same UID as the caller, the rules were changed starting with Linux 4.13.

Since Linux 4.13, permission is governed by a ptrace access mode PTRACE\_MODE\_READ\_REALCREDS check with respect to the target process; see ptrace(2).

count is the number of pages to move. It defines the size of the three arrays pages, nodes, and status.

pages is an array of pointers to the pages that should be moved. These are pointers that should be aligned to page boundaries. Addresses are specified as seen by the process specified by pid.

nodes is an array of integers that specify the desired location for each page. Each element in the array is a node number. nodes can also be NULL, in which case move\_pages() does not move any pages but instead will return the node where each page currently resides, in the status array. Obtaining the status of each page may be necessary to determine pages that need to be moved.

status is an array of integers that return the status of each page.

The array contains valid values only if move\_pages() did not return an error. Preinitialization of the array to a value which cannot represent a real numa node or valid error of status array could help to identify pages that have been migrated.

flags specify what types of pages to move. MPOL\_MF\_MOVE means that only pages that are in exclusive use by the process are to be moved.

MPOL\_MF\_MOVE\_ALL means that pages shared between multiple processes can also be moved. The process must be privileged (CAP\_SYS\_NICE) to use MPOL\_MF\_MOVE\_ALL.

#### Page states in the status array

The following values can be returned in each element of the status array.

0..MAX\_NUMNODES

Identifies the node on which the page resides.

-EACCES

The page is mapped by multiple processes and can be moved only if MPOL\_MF\_MOVE\_ALL is specified.

-EBUSY The page is currently busy and cannot be moved. Try again

later. This occurs if a page is undergoing I/O or another kernel?

nel subsystem is holding a reference to the page.

#### -EFAULT

This is a zero page or the memory area is not mapped by the process.

-EIO Unable to write back a page. The page has to be written back in order to move it since the page is dirty and the filesystem does not provide a migration function that would allow the move of dirty pages.

#### -EINVAL

A dirty page cannot be moved. The filesystem does not provide a migration function and has no ability to write back pages.

#### -ENOENT

The page is not present.

#### -ENOMEM

Unable to allocate memory on target node.

### RETURN VALUE

On success `move_pages()` returns zero. On error, it returns -1, and sets `errno` to indicate the error. If positive value is returned, it is the number of nonmigrated pages.

### ERRORS

Positive value

The number of nonmigrated pages if they were the result of non?

fatal reasons (since Linux 4.17). E2BIG Too many pages to move.

Since Linux 2.6.29, the kernel no longer generates this error.

EACCES One of the target nodes is not allowed by the current cpuset.

EFAULT Parameter array could not be accessed.

EINVAL Flags other than `MPOL_MF_MOVE` and `MPOL_MF_MOVE_ALL` was specified or an attempt was made to migrate pages of a kernel thread.

ENODEV One of the target nodes is not online.

EPERM The caller specified `MPOL_MF_MOVE_ALL` without sufficient privi?

leges (`CAP_SYS_NICE`). Or, the caller attempted to move pages of

a process belonging to another user but did not have privilege

to do so (CAP\_SYS\_NICE).

ESRCH Process does not exist.

## VERSIONS

move\_pages() first appeared on Linux in version 2.6.18.

## CONFORMING TO

This system call is Linux-specific.

## NOTES

For information on library support, see numa(7).

Use get\_mempolicy(2) with the MPOL\_F\_MEMS\_ALLOWED flag to obtain the set of nodes that are allowed by the current cpuset. Note that this information is subject to change at any time by manual or automatic reconfiguration of the cpuset.

Use of this function may result in pages whose location (node) violates the memory policy established for the specified addresses (See mbind(2)) and/or the specified process (See set\_mempolicy(2)). That is, memory policy does not constrain the destination nodes used by move\_pages().

The <numaif.h> header is not included with glibc, but requires installing libnuma-devel or a similar package.
