$ man ostree-admin-upgrade.1

OSTREE ADMIN UPGRADE(1)   ostree admin upgrade   OSTREE ADMIN UPGRADE(1)

NAME

    ostree-admin-upgrade - Construct new tree from current origin and

    deploy it, if it changed

SYNOPSIS

    ostree admin upgrade [OPTIONS...]

DESCRIPTION

    Downloads the latest version of the current ref from the build server

    and deploys it, if it changed. Reboot the machine for the changes to

    take effect. These phases can be split via --pull-only and

    --deploy-only.

OPTIONS

    --os="STATEROOT"

        Use a different operating system root than the current one.

    --pull-only

        Only perform a pull into the repository; do not create a

        deployment. This option can hence safely be used in a background

        scheduled job with the assurance of not changing system state.

--deploy-only

Create a new deployment from the latest commit in the tracked

origin refspec. This option is intended to be used by a scheduled

system that detected changes via --pull-only, and is ready to

deploy them.

--stage

Perform deployment finalization at shutdown time. Recommended, and

will likely become the default in the future.

--reboot,-r

Reboot after a successful upgrade.

--allow-downgrade

Permit deployment of chronologically older trees.

--override-commit="CHECKSUM"

Deploy CHECKSUM instead of the latest tree.

EXAMPLE

$ ostree admin upgrade

No update available.
