Red Hat Enterprise Linux Release 9.2 Manual Pages on 'podman-image-exists.1' command

$ man podman-image-exists.1

podman-image-exists(1)   General Commands Manual   podman-image-exists(1)

NAME

    podman-image-exists - Check if an image exists in local storage

SYNOPSIS

    podman image exists image

DESCRIPTION

    podman image exists checks if an image exists in local storage. The ID

    or Name of the image may be used as input. Podman will return an exit

    code of 0 when the image is found. A 1 will be returned otherwise. An

    exit code of 125 indicates there was an issue accessing the local stor?

    age.

OPTIONS

  --help, -h

    Print usage statement

EXAMPLES

    Check if an image called webclient exists in local storage (the image

    does actually exist).

        $ podman image exists webclient

        $ echo $?

        0

        $

    Check if an image called webbackend exists in local storage (the image

    does not actually exist).

```
$ podman image exists webbackend

$ echo $?

1

$
```
