

Red Hat Enterprise Linux Release 9.2 Manual Pages on 'podman-manifest-create.1' command

\$ man podman-manifest-create.1

podman-manifest-create(1) General Commands Manual podman-manifest-create(1)

NAME

podman-manifest-create - Create a manifest list or image index

SYNOPSIS

podman manifest create [options] listnameorindexname [imagename ...]

DESCRIPTION

Creates a new manifest list and stores it as an image in local storage using the specified name.

If additional images are specified, they are added to the newly-created list or index.

OPTIONS

--all

If any of the images which should be added to the new list or index are themselves lists or indexes, add all of their contents. By default, only one image from such a list will be added to the newly-created list or index.

--amend, -a

If a manifest list named listnameorindexname already exists, modify the preexisting list instead of exiting with an error. The contents of listnameorindexname are not modified if no *imagename*s are given.

--tls-verify

Require HTTPS and verify certificates when contacting registries (default: true). If explicitly set to true, TLS verification will be

used. If set to false, TLS verification will not be used. If not specified, TLS verification will be used unless the target registry is listed as an insecure registry in containers-registries.conf(5)

EXAMPLES

```
podman manifest create mylist:v1.11
```

```
9cfd24048d5fc80903f088f1531a21bff01172abe66effa8941a4c2308dc745f
```

```
podman manifest create --amend mylist:v1.11
```

```
9cfd24048d5fc80903f088f1531a21bff01172abe66effa8941a4c2308dc745f
```

```
podman manifest create mylist:v1.11 docker://fedora
```

```
5c2bc76bfb4ba6665a7973f7e1c05ee0536b4580637f27adc9fa5a4b2bc03cf1
```

```
podman manifest create --all mylist:v1.11 docker://fedora
```

```
