## ***Red Hat Enterprise Linux Release 9.2 Manual Pages on 'podman-network-exists.1' command***

### ***\$ man podman-network-exists.1***

podman-network-exists(1) General Commands Manual podman-network-exists(1)

#### NAME

podman-network-exists - Check if the given network exists

#### SYNOPSIS

podman network exists network

#### DESCRIPTION

podman network exists checks if a network exists. The Name or ID of the network may be used as input. Podman will return an exit code of 0 when the network is found. A 1 will be returned otherwise. An exit code of 125 indicates there was another issue.

#### OPTIONS

--help, -h

Print usage statement

#### EXAMPLE

Check if a network called net1 exists (the network does actually exist).

```
$ podman network exists net1
```

```
$ echo $?
```

```
0
```

```
$
```

Check if a network called webbackend exists (the network does not actually exist).

```
$ podman network exists webbackend
```

```
$ echo $?
```

```
1
```

```
$
```

#### SEE ALSO
