## **Red Hat Enterprise Linux Release 9.2 Manual Pages on 'podman-pod-exists.1' command**

### **\$ man podman-pod-exists.1**

podman-pod-exists(1)    General Commands Manual    podman-pod-exists(1)

#### NAME

podman-pod-exists - Check if a pod exists in local storage

#### SYNOPSIS

podman pod exists pod

#### DESCRIPTION

podman pod exists checks if a pod exists in local storage. The ID or Name of the pod may be used as input. Podman will return an exit code of 0 when the pod is found. A 1 will be returned otherwise. An exit code of 125 indicates there was an issue accessing the local storage.

#### EXAMPLES

Check if a pod called web exists in local storage (the pod does actually exist).

```
$ sudo podman pod exists web
```

```
$ echo $?
```

```
0
```

```
$
```

Check if a pod called backend exists in local storage (the pod does not actually exist).

```
$ sudo podman pod exists backend
```

```
$ echo $?
```

```
1
```

```
$
```
