| _   | _ISOC99_SOURCE    _POSIX_C_SOURCE >= 200112L              |                    |        |            |  |
|   | /* Since glibc 2.19: */ _DEFAULT_SOURCE                   |                    |        |            |  |
| <pre>scalbn(), scalbnf(), scalbnl():</pre>                              |   |                    |        |            |  |
| _ISOC99_SOURCE    _POSIX_C_SOURCE >= 200112L                            |   |                    |        |            |  |
|   | /* Since glibc 2.19: */ _DEFAULT_SOURCE                   |                    |        |            |  |
|   | /* Glibc versions <= 2.19: */ _BSD_SOURCE    _SVID_SOURCE |                    |        |            |  |
| DESCRIPTION   |   |                    |        |            |  |

These functions multiply their first argument x by  $\mathsf{FLT\_RADIX}$  (probably

2) to the power of exp, that is:

x \* FLT\_RADIX \*\* exp

The definition of FLT\_RADIX can be obtained by including <float.h>.

## **RETURN VALUE**

On success, these functions return x \* FLT\_RADIX \*\* exp.

If x is a NaN, a NaN is returned.

If x is positive infinity (negative infinity), positive infinity (nega?

tive infinity) is returned.

If x is +0 (-0), +0 (-0) is returned.

If the result overflows, a range error occurs, and the functions return

HUGE\_VAL, HUGE\_VALF, or HUGE\_VALL, respectively, with a sign the same

#### as x.

If the result underflows, a range error occurs, and the functions re?

turn zero, with a sign the same as x.

# ERRORS

See math\_error(7) for information on how to determine whether an error

has occurred when calling these functions.

The following errors can occur:

Range error, overflow

An overflow floating-point exception (FE\_OVERFLOW) is raised.

Range error, underflow

errno is set to ERANGE. An underflow floating-point exception

(FE\_UNDERFLOW) is raised.

#### VERSIONS

These functions first appeared in glibc in version 2.1.

# ATTRIBUTES

For an explanation of the terms used in this section, see at?

tributes(7).

?Interface ? Attribute ? Value ?

?

?scalbn(), scalbnf(), scalbnl(), ? Thread safety ? MT-Safe ?

?scalbln(), scalblnf(), scalblnl() ? ?

## CONFORMING TO

C99, POSIX.1-2001, POSIX.1-2008.

# NOTES

These functions differ from the obsolete functions described in scalb(3) in the type of their second argument. The functions described on this page have a second argument of an integral type, while those in scalb(3) have a second argument of type double.

If FLT\_RADIX equals 2 (which is usual), then scalbn() is equivalent to Idexp(3).

# BUGS

Before glibc 2.20, these functions did not set errno for range errors.

# SEE ALSO

ldexp(3), scalb(3)

#### COLOPHON

This page is part of release 5.10 of the Linux man-pages project. A description of the project, information about reporting bugs, and the latest version of this page, can be found at https://www.kernel.org/doc/man-pages/.
