# Red Hat Enterprise Linux Release 9.2 Manual Pages on 'scalbnl.3' command

# \$ man scalbnl.3

SCALBLN(3) Linux Programmer's Manual SCALBLN(3) NAME scalbn, scalbnf, scalbnf, scalbln, scalblnf, scalblnf - multiply float? ing-point number by integral power of radix **SYNOPSIS** #include <math.h> double scalbln(double x, long exp); float scalbInf(float x, long exp); long double scalblnl(long double x, long exp); double scalbn(double x, int exp); float scalbnf(float x, int exp); long double scalbnl(long double x, int exp); Link with -lm. Feature Test Macro Requirements for glibc (see feature\_test\_macros(7)): scalbln(), scalblnf(), scalblnl(): \_ISOC99\_SOURCE || \_POSIX\_C\_SOURCE >= 200112L || /\* Since glibc 2.19: \*/ \_DEFAULT\_SOURCE scalbn(), scalbnf(), scalbnl(): \_ISOC99\_SOURCE || \_POSIX\_C\_SOURCE >= 200112L || /\* Since glibc 2.19: \*/ \_DEFAULT\_SOURCE || /\* Glibc versions <= 2.19: \*/ \_BSD\_SOURCE || \_SVID\_SOURCE

# **DESCRIPTION**

```
2) to the power of exp, that is:
```

```
x * FLT RADIX ** exp
```

The definition of FLT\_RADIX can be obtained by including <float.h>.

#### **RETURN VALUE**

On success, these functions return x \* FLT\_RADIX \*\* exp.

If x is a NaN, a NaN is returned.

If x is positive infinity (negative infinity), positive infinity (nega?

tive infinity) is returned.

If x is +0 (-0), +0 (-0) is returned.

If the result overflows, a range error occurs, and the functions return

HUGE\_VAL, HUGE\_VALF, or HUGE\_VALL, respectively, with a sign the same

as x.

If the result underflows, a range error occurs, and the functions re?

turn zero, with a sign the same as x.

#### **ERRORS**

See math\_error(7) for information on how to determine whether an error

has occurred when calling these functions.

The following errors can occur:

Range error, overflow

An overflow floating-point exception (FE\_OVERFLOW) is raised.

Range error, underflow

errno is set to ERANGE. An underflow floating-point exception

(FE\_UNDERFLOW) is raised.

# **VERSIONS**

These functions first appeared in glibc in version 2.1.

# **ATTRIBUTES**

For an explanation of the terms used in this section, see at?

tributes(7).

?Interface ? Attribute ? Value ?

?scalbn(), scalbnf(), scalbnl(), ? Thread safety ? MT-Safe ?

?scalbln(), scalblnf(), scalblnl() ?

?

# **CONFORMING TO**

C99, POSIX.1-2001, POSIX.1-2008.

#### **NOTES**

These functions differ from the obsolete functions described in scalb(3) in the type of their second argument. The functions described on this page have a second argument of an integral type, while those in scalb(3) have a second argument of type double.

If FLT\_RADIX equals 2 (which is usual), then scalbn() is equivalent to Idexp(3).

#### **BUGS**

Before glibc 2.20, these functions did not set errno for range errors.

# SEE ALSO

ldexp(3), scalb(3)

#### COLOPHON

This page is part of release 5.10 of the Linux man-pages project. A description of the project, information about reporting bugs, and the latest version of this page, can be found at https://www.kernel.org/doc/man-pages/.
