

Red Hat Enterprise Linux Release 9.2 Manual Pages on 'seapplet.1' command

\$ man seapplet.1

seapplet(1) General Commands Manual seapplet(1)

NAME

seapplet - setroubleshoot client GUI applet

SYNOPSIS

seapplet

DESCRIPTION

seapplet is a GTK²-based GUI applet designed to notify users of new SELinux alerts and open sealert to assist with their resolution. Seapplet is normally started at login by the desktop session manager and does not need to be executed manually. In order to function properly, seapplet requires that the desktop environment provides a System Tray implementation in which the applet will be embedded.

SEE ALSO
