

## ***Red Hat Enterprise Linux Release 9.2 Manual Pages on 'sg\_reset\_wp.8' command***

***\$ man sg\_reset\_wp.8***

SG\_RESET\_WP(8)                    SG3\_UTILS                    SG\_RESET\_WP(8)

### NAME

sg\_reset\_wp - send SCSI RESET WRITE POINTER command

### SYNOPSIS

sg\_reset\_wp [--all] [--count=ZC] [--help] [--verbose] [--version]  
[--zone=ID] DEVICE

### DESCRIPTION

Sends a SCSI RESET WRITE POINTER command to the DEVICE. This command is found in the soon to be released ZBC standard (draft prior to standard: zbc-r05.pdf).

### OPTIONS

Arguments to long options are mandatory for short options as well.

-a, --all

sets the ALL field in the cdb. This causes a reset write pointer operation of all open zones and full zones. When this option is given then the --zone=ID option is ignored. Either this option or the --zone=ID option is required.

-C, --count=ZC

ZC is placed in the Zone Count field in the cdb of the RESET WRITE POINTER command supported by this utility. ZC should be a value from 0 to 65535 (0xffff) inclusive.

-h, --help

output the usage message then exit.

-v, --verbose

increase the level of verbosity, (i.e. debug output).

-V, --version

print the version string and then exit.

-z, --zone=ID

where ID is placed in the cdb's ZONE ID field. A zone id is a zone start logical block address (LBA). This causes a reset write pointer operation on the zone identified by the ZONE ID field. The default value is 0. Either this option or the --all option is required. ID is assumed to be in decimal unless prefixed with '0x' or has a trailing 'h' which indicate hexadecimal.

## EXIT STATUS

The exit status of sg\_reset\_wp is 0 when it is successful. Otherwise see the sg3\_utils(8) man page.
