$ man update-gtk-immodules.1

UPDATE-GTK-IMMODULES(1)   User Commands   UPDATE-GTK-IMMODULES(1)

NAME

    update-gtk-immodules - Update GTK+ immodule cache

SYNOPSIS

    update-gtk-immodules [HOST_TRIPLET]

DESCRIPTION

    update-gtk-immodules is a wrapper around gtk-query-immodules-2.0 that

    tries to help with multilib installations. It is meant to be used in

    %post scripts of rpm packages that install input method modules for

    GTK+ 2.x.

    It needs to be given a GNU-style host triplet as argument, such as

    "x86_64-redhat-linux-gnu". This argument determines where the tool

    saves the gtk.immodules file that it creates. It must be the same as

    the host triplet that GTK+ was configured with.

FILES

    $libdir/gtk-2.0/2.10.0/immodules.cache - the file created by update-

    gtk-immodules.
