Red Hat Enterprise Linux Release 9.2 Manual Pages on 'usb-devices.1' command

$ man usb-devices.1

usb-devices(1)　　　　　Linux USB Utilities　　　　　usb-devices(1)

NAME

    usb-devices - print USB device details

SYNOPSIS

    usb-devices

DESCRIPTION

    usb-devices is a shell script that can be used to display details of

    USB buses in the system and the devices connected to them.

    The output of the script is similar to the usb/devices file available

    either under /proc/bus (if usbfs is mounted), or under /sys/kernel/de?

    bug (if debugfs is mounted there). The script is primarily intended to

    be used if the file is not available.

    In contrast to the usb/devices file, this script only lists active in?

    terfaces (those marked with a "*" in the usb/devices file) and their

    endpoints.

    Be advised that there can be differences in the way information is

    sorted, as well as in the format of the output.

RETURN VALUE

    If sysfs is not mounted, a non-zero exit code is returned.

FILES

    /sys/bus/usb/devices/usb*

        The part of the sysfs tree the script walks through to assemble

        the printed information.

/proc/bus/usb/devices

Location where the usb/devices file can normally be found for

Linux kernels before 2.6.31, if usbfs is mounted.

/sys/kernel/debug/usb/devices

Location where the usb/devices file can normally be found for

Linux kernel 2.6.31 and later, if debugfs is mounted.

SEE ALSO

lsusb(8), usbview(8).
