Red Hat Enterprise Linux Release 9.2 Manual Pages on 'wvtag.1' command

$ man wvtag.1

WVTAG(1)   WavPack Executable Programs   WVTAG(1)

NAME

    wvtag - metadata utility for wavpack files

SYNOPSIS

    wvtag [-options] INFILE...

DESCRIPTION

    wvtag applies the specified metadata operation(s) to each of the

    specified WavPack source file(s) in this order: clean, import, delete,

    write, extract, list. Note that WavPack metadata is stored in APEv2

    tags, and this tool will automatically import from an ID3v1 tag if it

    is the only tag present on the source file, and that ID3v1 tag will be

    deleted and replaced with an APEv2 tag if an edit is requested.

OPTIONS

    --allow-huge-tags

        allow tag data up to 16 MB (embedding > 1 MB is not recommended for

        portable devices and may not work with some programs including

        WavPack pre-4.70)

    -c

        extract cuesheet only to stdout (equivalent to -x ?cuesheet?)

    -cc

        extract cuesheet to source-name.cue file in same directory as

        source file (equivalent to -xx ?cuesheet=%a.cue?)

    --clean, --clear

clean all items from tag (done first)

-d ?Field?

delete specified metadata item (text or binary)

-h, --help

this help display

--import-id3

import applicable tag items from ID3v2.3 tag present in DSF (and

other) files into APEv2 tag (if there are > 1 MB cover images

present add --allow-huge-tags to include them)

-l, --list

list all tag items (done last)

--no-utf8-convert

don't recode passed tags from local encoding to UTF-8, assume they

are in UTF-8 already

-q

quiet (keep console output to a minimum)

-v, --version

write program version to stdout

-w ?Field=?

delete specified metadata item (text or binary)

-w ?Field=Value?

write specified text metadata to APEv2 tag

-w ?Field=@file.ext?

write specified text metadata from file to APEv2 tag, normally used

for embedded cuesheets and logs (field names ?Cuesheet? and ?Log?)

--write-binary-tag ?Field=@file.ext?

write the specified binary metadata file to APEv2 tag, normally

used for cover art with the specified field name ?Cover Art

(Front)?

-x ?Field?

extract the specified tag field only to stdout

-xx ?Field[=file]?

extract the specified tag field to named file in same directory as

source file; optional filename specification may contain %a which

is replaced with the audio file base name, %t replaced with the tag

field name (note: comes from data for binary tags) and %e replaced

with the extension from the binary tag source file (or ?txt? for

text tag).

-y

yes to all warnings (use with caution!)
